Cancer Incidence in Five Continents

Volume XII

INTERNATIONAL AGENCY FOR RESEARCH ON CANCER

The International Agency for Research on Cancer (IARC) was established in 1965 by the World Health Assembly, as an independently financed organization within the framework of the World Health Organization (WHO). The headquarters of the Agency are in Lyon, France.

The Agency conducts a programme of research concentrating particularly on the epidemiology of cancer and the study of potential carcinogens in the human environment. Its epidemiological studies are supplemented by studies of the mechanisms of carcinogenesis carried out in the Agency's laboratories in Lyon. The promotion of collaborative research among scientists worldwide is a strong feature of the Agency's activities. The Agency also conducts a programme for the education and training of personnel for cancer research.

The publications of the Agency are intended to contribute to the dissemination of authoritative information on various aspects of cancer research. Information about IARC publications and how to order them is available online at <https://publications.iarc.who.int/>.

INTERNATIONAL ASSOCIATION OF CANCER REGISTRIES

The International Association of Cancer Registries (IACR) was created following the Ninth International Cancer Congress, held in Tokyo, in 1966. The Association is a voluntary nongovernmental organization in official relations with WHO, representing the scientific and professional interests of cancer registries, with members interested in the development of cancer registration and its application to studies of well-defined populations.

There are currently more than 700 member registries in IACR, along with an elected executive board. Since 1973, IARC has provided a secretariat for the Association, with the primary functions of organizing meetings and coordinating scientific studies. Information about the Association, including membership, activities, and publications, is available online at <http://www.iacr.com.fr/>.

Third-party materials.

If you wish to reuse material from this work that is attributed to a third party, such as tables, figures or images, it is your responsibility to determine whether permission is needed for that reuse and to obtain permission from the copyright holder. The risk of claims resulting from infringement of any third-party-owned component in the work rests solely with the user.

General disclaimers.

The designations employed and the presentation of the material in this publication do not imply the expression of any opinion whatsoever on the part of WHO or contributing agencies concerning the legal status of any country, territory, city or area or of its authorities, or concerning the delimitation of its frontiers or boundaries. Dotted and dashed lines on maps represent approximate border lines for which there may not yet be full agreement.

The mention of specific companies or of certain manufacturers' products does not imply that they are endorsed or recommended by WHO or contributing agencies in preference to others of a similar nature that are not mentioned. Errors and omissions excepted, the names of proprietary products are distinguished by initial capital letters.

All reasonable precautions have been taken by WHO to verify the information contained in this publication. However, the published material is being distributed without warranty of any kind, either expressed or implied. The responsibility for the interpretation and use of the material lies with the reader. In no event shall WHO or contributing agencies be liable for damages arising from its use.

Foreword

Almost 60 years have passed since Sir Richard Doll and colleagues published the first volume of *Cancer Incidence in Five Continents (CI5)* as a compendium of reliable cancer incidence data in different geographical locations. Now in its 12th volume, this long-standing collaboration between the International Agency for Research on Cancer (IARC) and the International Association of Cancer Registries (IACR) serves as a unique source of cancer incidence data from high-quality population-based cancer registries (PBCRs) around the world. Each volume provides comparable quinquennial data on incident cancers and serves as a unique documentation of the current and evolving magnitude and profile of cancer in different locations.

In the first volume of CI5, data on only 32 PBCRs in 29 countries were compiled. Over subsequent decades, international cancer registry coverage has expanded, and this 12th volume of CI5, based on cancers diagnosed during the period 2013–2017, contains high-quality cancer incidence data from 460 PBCRs in 65 countries. The exponential rise in the number of PBCRs worldwide points to PBCRs being recognized as a cornerstone of cancer research and cancer control. Yet there remain challenges, old and new. The most pressing is to ensure that countries in transitioning regions invest in improvements in data collection, recognizing PBCRs as an asset rather than a cost in health planning.

Led by IARC, a complementary programme to CI5 is the Global Initiative for Cancer Registry Development (GICR), the first worldwide strategy to inform cancer control through better data. Given that only two in three countries currently have high-quality cancer registration data, the GICR focuses on supporting the sustainable development of PBCRs in transitioning regions where the need is greatest, ultimately seeking to save lives by providing decision-makers with the information they need to tackle the cancer burden. The GICR is a partnership with leading cancer organizations committed to strengthening the quality, availability, and use of cancer data. A marker of its success will be to see a larger proportion of PBCRs in transitioning countries included in future volumes of CI5.

I take this opportunity to personally thank all the registry staff of each of the PBCRs worldwide for submitting their cancer incidence data to this volume of CI5 and, in doing so, supporting IARC's primary aim of promoting international collaboration in cancer research.

Chapter 1: Introduction and guide to this volume

Freddie Bray, Murielle Colombet, Joanne F. Aitken, Aude Bardot, Sultan Eser, Jaume Galceran, Marc Hagenimana, Tomohiro Matsuda, Les Mery, Marion Piñeros, Isabelle Soerjomataram, Esther de Vries, Charles Wiggins, Young-Joo Won, Ariana Znaor, and Jacques Ferlay

The main objective of the *Cancer Incidence in Five Continents (CI5)* series, now in its 12th volume, is as an exposition of comparable cancer incidence data from around the globe. The series is a joint publication of the International Agency for Research on Cancer (IARC) and the International Association of Cancer Registries (IACR). Each volume provides unique insights into the occurrence of cancer, based on the high-quality data that are made available by population-based cancer registries. As with every volume of CI5, the principal aim of Volume XII is to ensure that the information included can be reliably used to compare geographical and temporal patterns in cancer incidence. The sheer variation in cancer incidence worldwide – whether rates are compared across registry populations (within a volume) or within a registry population over time (across volumes) – continues to provide compelling evidence of the environmental, lifestyle, and infectious origin of many types of cancer and, by extension, their potential avoidability (Doll et al., 1966; Bray et al., 2015).

To ensure appropriate representation from IACR and to anticipate the additional workload involved with an increasing number of submissions, the CI5 Volume XII Editorial Board was extended to include representation from Africa, the Asia–Pacific region, and the Americas. The 16 editors of CI5 Volume XII have endeavoured to uphold the long-standing principles of meticulous review of data quality across the submitted datasets, which document cancers diagnosed in the registry populations during the period 2013–2017.

CALL FOR DATA

Given the data protection regulations in place, including the General Data Protection Regulation (GDPR) drafted and passed by the European Union (EU), there were some challenges to international transfer of data to IARC. However, solutions were developed to ensure that all registries could send datasets for possible inclusion in Volume XII.

The call for data and an accompanying questionnaire were sent to all population-based cancer registries

outside of Europe in July 2021. The call for data and the questionnaire were also published on the IACR website; the documents were available in English, French, and Spanish. Registries that wished to submit datasets for Volume XII were requested to do so using the IARC Registries Portal (see Chapter 6), and the questionnaire was available for completion online. Detailed instructions for preparing the registry dataset and the accompanying mortality and population information were provided in the call for data. In some countries, registries delegated data submission to their national associations or networks, but each registry was required to submit its own responses to the questionnaire.

Under the current circumstances, it was agreed that the European Network of Cancer Registries (ENCR) and the Secretariat hosted at the Joint Research Centre of the European Commission (JRC) would run independent data calls. The call for data and accompanying questionnaires were sent to European registries in early 2022. Because several registries in Europe and in other regions expressed concern that they would not be able to submit individual-level data in response to the call for data, an aggregating tool was developed at IARC. The software package IARctoolsTAB (Colombet et al., 2020) comprises a set of routines written in **R** that validate the registry incidence data file and generate an aggregated dataset that is suitable for a standard evaluation by the editors of CI5 (see Chapter 6).

Although the reference period for Volume XII was defined as 2013–2017, contributors were also asked to send data for the years before and (if available) after the reference period, to enable the volume editors to verify certain aspects of quality, comparability, and completeness for each submission. Not all registries were able to provide data for the entire 5-year period covered by Volume XII, but a minimum consecutive series of 3 years was required for a registry to be considered for inclusion.

NUMBER OF DATASETS RECEIVED AND INCLUDED

Datasets were received from 675 cancer registries covering 813 populations in 99 countries. After the evaluation, datasets from 215 cancer registries,

representing 224 populations, were excluded. Consequently, Volume XII presents cancer incidence data from 65 countries, 460 cancer registries, and 589 populations (Table 1.1).

Table 1.1. Geographical coverage in CI5 Volume XII, worldwide and by continent

| | Countries | | Registries | | Populations | |
|---|-----------|--------------|------------|--------------|-------------|--------------|
| | Submitted | Accepted (%) | Submitted | Accepted (%) | Submitted | Accepted (%) |
| Worldwide | 99* | 65* (66%) | 675 | 460 (68%) | 813 | 589 (72%) |
| Africa | 19 | 10 (53%) | 32 | 14 (44%) | 34 | 14 (41%) |
| Central and South America and the Caribbean | 15 | 11 (73%) | 42 | 27 (64%) | 42 | 27 (64%) |
| North America | 3 | 2 (67%) | 64 | 63 (98%) | 180 | 175 (97%) |
| Asia | 30 | 14 (47%) | 391 | 223 (57%) | 400 | 230 (58%) |
| Europe | 33 | 29 (88%) | 136 | 123 (90%) | 136 | 123 (90%) |
| Oceania | 4 | 4 (100%) | 10 | 10 (100%) | 21 | 20 (95%) |

*The sum of the number of individual countries across continents is greater than the total figure, reflecting the fact that some countries (i.e. France and the USA) have territory on more than one continent.

GEOGRAPHICAL COVERAGE IN CI5 VOLUME XII

Table 1.1 also shows the geographical coverage in CI5 Volume XII by continent. Among those countries that submitted datasets to this volume, data were included from 10 of the 19 countries in Africa, 11 of the 15 countries in Central and South America and the Caribbean, 2 of the 3 countries in North America, 14 of the 30 countries in Asia, 29 of the 33 countries in Europe, and all 4 of the 4 countries in Oceania.

The proportions of cancer registries that submitted datasets for Volume XII and were accepted for inclusion varied considerably by region, with acceptance proportions of 44% (14 of 32 registries) in Africa, 64% (27 of 42 registries) in Central and South America and the Caribbean, 98% (63 of 64 registries) in North America, 57% (223 of 391 registries) in Asia, 90% (123 of 136 registries) in Europe, and 100% (10 of 10 registries) in Oceania.

The proportion of the world's total population covered by the registries included in Volume XII was 19% (up from 15% in Volume XI). The following levels of coverage by continent were attained: 2% in Africa, 8% in Central and South America and the Caribbean, 98% in North America, 13% in Asia, 48% in Europe, and 75% in Oceania.

COVERAGE IN CI5 VOLUMES I-XII

Fig. 1.1 shows the overall coverage in terms of the number of countries, registries, and populations included in each volume of CI5. An overview of all registry populations appearing across the 12 volumes, as well as the specific incidence periods contributed by each registry, is provided in Table 1.2 at the end of this chapter. Of note in Volume XII is the large increase in cancer registry submissions from China, as part of

the country's ongoing implementation of extended population coverage of cancer registration. There were 261 registry submissions from China in response to the call for data, compared with 103 submissions for Volume XI and 30 submissions for Volume X. In addition, a number of established registries were unable to submit data for this call; several registries (predominantly in Central and South America and the Caribbean) cited the impact of the COVID-19 pandemic on their operations as a critical factor.

The editors have made every effort to standardize the data presented or, where this was not possible, to draw attention to any differences that might affect comparability between registries. The editorial processes of checking internal coherence, consistency, and completeness are described in Chapters 5 and 6 of this volume and are broadly based on principles outlined in IARC Scientific Publication No. 95 (Jensen et al., 1991), IARC Technical Publication No. 43 (Bray et al., 2014), and a two-part review of practical techniques for evaluation of data quality at the cancer registry (Bray and Parkin, 2009; Parkin and Bray, 2009).

With improved definition of registration methodology and increased adherence to internationally recognized practices, more stringent editorial processes are needed, and the editors of each successive volume are more demanding with regard to the quality of the published datasets. However, the editors also have to accept that some datasets from registries in low- and middle-income countries may be less complete than those from registries in high-income countries, because of problems of underdiagnosis due to local medical and economic situations (as opposed to underregistration) and/or problems with enumeration of the population. These datasets are still of great interest because they

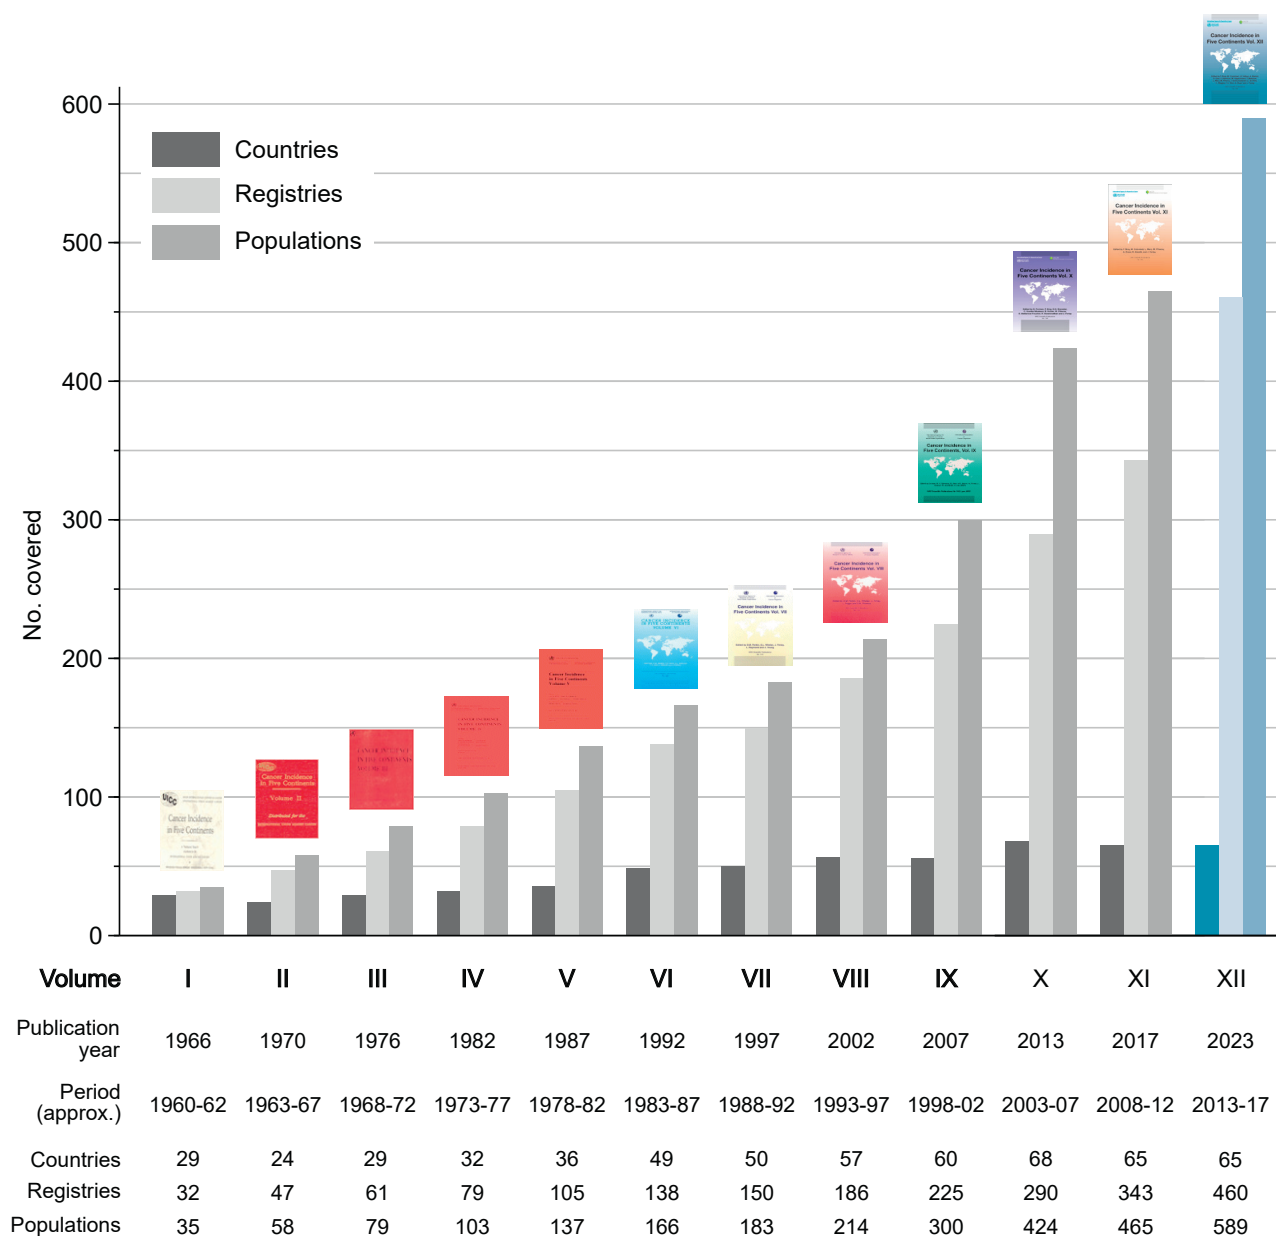

Fig. 1.1. Coverage in the 12 volumes of CI5: number of countries, registries, and registry populations included.

describe cancer incidence in unique populations for which often no other information is available.

On the pages of this volume that present tables reporting the data from each registry by site, an asterisk preceding the registry title indicates that special considerations (which may include underregistration) must be taken into account in interpreting the published rates or indicators of quality (see Chapter 5). The specific reasons for a given asterisk are stated under the heading “Notes on the data” in the accompanying text.

CONTENT AND LAYOUT OF THE BOOK

Like the previous volume, Volume XII is published online on a dedicated website (<https://ci5.iarc.who.int/CI5-XII/>). The website has separate menus for the chapters and the tables, including the registry summary tables,

comparative tables of incidence by three- and four-digit codes of the International Statistical Classification of Diseases and Related Health Problems, 10th revision (ICD-10) and, for 15 selected cancer sites, by histological subtype, as well as the indices of data quality. Building on this, the IACR website is undergoing a major revision with the intention to elevate awareness of the value of the individual registry datasets, while making comparative analyses easily accessible (see the *Future directions* section later in this chapter). The text below refers to the contents of this book.

Chapters

Maps showing the location of each contributing registry are provided on the initial pages before this introductory chapter. Chapter 2 describes the registries in terms

of geographical location, legislative background, and registration practices. Chapter 3 presents the system of classification used to report the incidence data and addresses the issue of comparability of coding practices between the registries. For selected cancers, the data have been analysed by histological subtype within site. Chapter 4 introduces the histological groupings used and explains the rationale behind them.

Issues that can affect comparability between registries and validity of registry data are discussed in Chapter 5, as are the methods by which the submitted datasets were assessed. Chapter 6 describes how the raw data received for CI5 were processed. Finally, Chapter 7 describes the summary measures of incidence used in this volume to enable comparisons across registry populations.

Registry summary tables

After the standard introductory chapters, registry-specific entries are presented in alphabetical order within each world region. Each population label includes the name of the country, the name of the region (if applicable), the name of the subpopulation (such as racial or ethnic group, if applicable), and the period of data contribution. Each registry-specific entry provides a list of individual contributors at the registry, together with summary statistics from the accepted dataset.

For each population defined by a registry, a population pyramid is provided, showing the average annual person-years at risk during the reference period, for males and females, in 5-year age groups. The number of age groups depends on the age distribution of the population data provided. The horizontal bars of the pyramids represent the percentage contribution of each sex–age group to the total population. References to the source(s) of population data are provided.

The sex-specific age-standardized rates per 100 000 population (using the world standard population; see Chapter 7) observed in each registry area during the reference period are tabulated for the most common cancers and for all sites combined. In addition, a one-page overview table per population presents sex-specific statistics for all ages: the total number of cases, the percentage contribution of each cancer site to the total, and the incidence rates (crude and standardized rates per 100 000, and cumulative rates for the age ranges 0–64 years and 0–74 years, expressed as percentages). The cancer sites are arranged in ascending order of ICD-10 codes, which are displayed along with the site labels. Where applicable, these tables are provided for each subpopulation defined by the registry.

Comparative cancer incidence tables

Comparative summary tables are provided by site (ICD-10 three-digit rubrics). The set of tables shows all cancers combined (including and excluding non-melanoma skin cancers), the three-digit (ICD-10) cancer sites (as described in Chapter 3), and the three grouped categories “Head and neck”, “Colon and rectum”, and “Leukaemia”. Each table for these categories shows sex-specific data for all ages combined, including the number of cases, the age-

standardized incidence rate (using the world standard population), and the cumulative incidence rate for the age range 0–74 years. The rates are accompanied by their standard errors.

All submitted datasets were subjected to computerized records checks and editorial review. The decision about whether to include a given dataset in Volume XII was largely based on the indicators of data quality, which are described and tabulated in Chapter 5. Other indicators are presented systematically for all registries in the site-specific tables titled *Indices of data quality* located at the end of this volume.

FUTURE DIRECTIONS

The long-standing collaboration between IARC and IACR serves as a unique source of cancer incidence data from high-quality population-based cancer registries around the world. The recording and assessment of rates remains a core task of cancer registries today, and the function of this collaboration is to report registry results using a common format. CI5 continues to be an invaluable resource for cancer research and cancer control worldwide, and it is the primary source of the national (GLOBOCAN) estimates in 185 countries and territories by cancer, sex, and age, which are available for online analysis on the IARC Global Cancer Observatory website, currently for 2022 (<https://gco.iarc.who.int/today/>).

For these reasons, the CI5 volume structure – encompassing a quinquennial review and compilation of submitted datasets – continues to serve many important purposes. Nevertheless, the online presence of CI5 needs rejuvenation to draw greater attention to the uniqueness of local incidence data as an evidence base for cancer research and cancer control. Building on the Global Cancer Observatory subsite, geographical and temporal analyses of individual registry datasets accepted in the 12 volumes of CI5 will be made available via a dedicated IACR website. Although there is a trade-off between the requirement for timely data and other aspects of data quality at the registry (Bray and Parkin, 2009), IACR and IARC have a responsibility to showcase this aspect of registry best practice. Therefore, registries included in the three most recent volumes of CI5 will be able to submit (aggregated) datasets on a regular basis to ensure that the website contains timely registry data for trend analyses that is independent of the CI5 cycle.

ACKNOWLEDGEMENTS

The CI5 Volume XII Editorial Board, IACR, and IARC take this opportunity to thank the many directors and registrars of cancer registries around the world that submitted their data to CI5 Volume XII, for their efforts to produce cancer incidence data and make them available to the global community. Their work remains the cornerstone of descriptive cancer epidemiology and provides a basis for future cancer research and cancer control policies.

The editors would like to thank Maria Fernan (“Chelle”) for the considerable time spent documenting the evaluations of each dataset and questionnaire and liaising individually with the submitting cancer registries.

Chapter 2: Registration techniques

Marion Piñeros, Les Mery, and Ariana Znaor

Cancer registration procedures differ globally from region to region and are at least in part dependent on local factors, including the level of development of cancer information systems, the potential for data linkages, and the resources available to the registry. The *Cancer Incidence in Five Continents (CI5)* series compiles a set of comparable high-quality data on the incidence rates of specific cancers in different populations and over time. Nevertheless, data users are advised to consider the factors related to registration techniques that may lead to artefactual differences. The primary purpose of this chapter is to describe variations between the cancer registries included in CI5 Volume XII – including variations in populations, the methods and standards used to collect data on new cases, and the sources of data accessed.

All contributors were required to complete an online questionnaire to provide descriptive information about their registry. For each registry, information was collected about the nature and size of the geographical area covered, the reporting facilities and data sources, the procedures for case finding and data abstraction, the coding methods, the type of data collected on incident cases, and the methods of follow-up for vital status. The information provided by each registry included in this volume is tabulated in Tables 2.1–2.3 at the end of this chapter. The majority (380) of the registries included in this volume (460) completed the questionnaire; for 61 registries, the information provided in Volume XI was used.

REGISTRY BACKGROUND (TABLE 2.1)

Table 2.1 lists the registries that contributed to this volume (grouped by geographical area) and provides information about several variables that describe each registry's characteristics, population size, and some basic aspects of operation. The significance of each variable included in Table 2.1 is described here.

Population: The size of the total population at risk on which a rate estimate is based influences the accuracy of that estimate. Rate estimates based on small numbers of individuals are more susceptible to the effects of random variation than are estimates based on large populations. Summary information about each cancer registry is provided later in this volume, including the age distribution of the estimated populations at risk and the specific sources of the population data. These are usually official sources, such as census data, and projections based on information about birth, death, and migration rates. Estimates tend to be more accurate for years closer to a census, and estimates based on interpolations

between censuses tend to be more accurate than are projections based only on the previous census. The estimated populations for each registry, listed in Table 2.1, are the estimated average total populations covered during the reporting period (generally 2013–2017, although some registries provided data for a shorter period).

Surface area (km²) and Population in urban area (%):

Cancer registries or registry networks in transitioned countries, such as the National Program of Cancer Registries (NPCR) and the Surveillance, Epidemiology, and End Results (SEER) Program in the USA, may cover very large geographical areas (entire provinces, states, or countries), whereas the covered populations in transitioning countries are often limited to urban centres. This is due to well-recognized difficulties with the diagnosis and enumeration of cancer cases in rural settings, in particular if the data collection relies on paper-based data sources. Although the calculated incidence rate for an urban area may be a reasonable estimate of the true rate in that community, the rate may not be representative of the entire country in which the registry is located, because lifestyles may be different in rural versus urban populations and in different geographical subregions within a country. In contrast, some of the registries that cover the largest surface areas are those with very low population density, for example in Australia, as well as those near the Arctic Circle, including parts of Canada, the Arkhangelsk region in the Russian Federation, and Alaska in the USA.

Latitude: The incidence rates of some cancers vary with latitude. This variation may provide evidence of the role of ultraviolet radiation (sunlight) in the etiology of certain cancers; however, similar variations in the rates of other cancers remain unexplained. Information about latitude is provided in Table 2.1 for those interested in investigating this phenomenon further.

Year registry started and Year population-based data first available: Developing a highly complete and accurate cancer registry takes time. Therefore, data from recently established registries should be interpreted with some caution. Rates may be underestimated because of incomplete registration. Alternatively, during the early years of data collection, prevalent cases (especially from death certificate diagnosis) may be erroneously included as new incident cases, resulting in the overestimation of incidence rates.

Cancer reportable (yes or no): Legislation or administrative orders making cancer a reportable disease and requiring the reporting of cancers to a registry do not guarantee completeness of reporting. Conversely, the absence of such reporting requirements does not necessarily prevent complete case finding. However, laws or rules requiring reporting generally do enhance registry operations, by ensuring access to (or reporting from) all facilities that diagnose or treat cancer, including those in the private sector. Of the 441 registries in CI5 Volume XII that provided this information, cancer reporting was included in legislation (L) in 173 (39%) and was regulated by an administrative order (A) in 170 (39%).

Privacy regulations apply (yes or no): An increasing number of registries must operate under privacy regulations that govern the confidentiality of all patient-level data they handle. Such regulations may affect both the ease with which registries can collect data and their ability to share their data with the research community.

Non-residents treated inside registration area (%) and Estimated cases missed because of problems accessing data sources (%): When a registry catchment area has a well-reputed cancer care centre that provides treatment and diagnosis to the population, the number of non-residents treated in the area may be higher than usual. If these non-resident cancer cases are included in the cancer registry database and incidence reporting, local rates may be overestimated. Conversely, if there is a cancer centre within reasonable travelling distance outside of a registry catchment area, that area's rates may be underestimated.

Screening programmes (and starting years, if available): The final five columns of Table 2.1 indicate the starting years of population-based screening programmes for breast, cervical, colorectal, prostate, and oral cancers within the registration areas. These dates are important to consider because the accelerated detection of prevalent cases can inflate incidence estimates, especially during the early years of screening programmes. The abbreviation "NA" (for "not applicable") indicates that a programme does not yet exist in the area.

CASE FINDING, ABSTRACTING, AND CODING (TABLE 2.2)

Table 2.2 lists the usual data sources (primarily diagnostic and clinical facilities) from which cases are identified by each participating cancer registry, and which therefore serve as the basis for the information that is abstracted and recorded by the registry. The most important of these sources are typically pathology laboratories (used in all registries except 29 in China, Japan, Latvia, and Turkey), hospital records (from both public and private hospitals), and death certificates. Of the 441 cancer registries in CI5 Volume XII that responded to the questionnaire, public hospital inpatient records are used as a data source in 416 (94%) of the registries, and private hospital

inpatient records are available to 328 (74%) of the registries. Together, these sources can provide a reasonably high level of reporting. However, access to records from radiotherapy and oncology departments, hospital discharge records, imaging facilities, and haematology laboratories can also be important. Some registries also obtain information from hospices and palliative care services, outpatient departments, general practitioners, and health insurance companies. In low- and middle-income countries, there is still a major lack of availability of death certificates, mostly because of the low quality of mortality statistics in general. Of the 441 responding registries, 370 (84%) had access to all death certificates, and 384 (87%) had access to cancer death certificates from the registration area.

Information from autopsy services is also used by some registries, but the inclusion of cases identified as incidental findings at autopsy may spuriously increase incidence rates. However, because autopsy is becoming an increasingly infrequent routine procedure, this source of error is likely to be minor. About 45% of the registries included in CI5 Volume XII stated that autopsy services were used as a data source.

In general, the more sources used for case finding, the more complete and accurate the reporting. Significant omissions may raise concerns that case finding is incomplete. For example, the absence of any information from radiotherapy facilities would likely be due to a lack of such facilities in the registration area, which might therefore suggest that some cases are missed because patients must go outside the registration area for care. However, the unavailability of some sources does not necessarily indicate underregistration; for example, the absence of private hospital information in a country with universal public health care may not affect registration. The use of multiple sources of case finding requires efficient record matching and de-duplication procedures to ensure that all records pertaining to the same case are brought together in a single registration, so that multiple recordings of the same cancers do not lead to the overestimation of incidence rates.

TYPES OF INFORMATION RECORDED (TABLE 2.3)

Table 2.3 indicates whether certain patient-level variables are recorded by each of the cancer registries included in CI5 Volume XII, which may be of interest to researchers wishing to conduct studies in collaboration with the registries. The majority (88%) of the 441 registries providing the information record unique identifying (ID) numbers (such as national identity numbers, social security numbers, or national health insurance numbers), and this can be very useful for record-linkage studies. Almost all registries are required to anonymize their data by using a registry-generated ID number as an alternative to storing patient names (or addresses) in their databases. The other patient-level variables included in Table 2.3 are ethnic group (or race/colour), stage of disease at diagnosis (for selected cancers), and nature of the initial clinical treatment received. Data on ethnic group are recorded by 57% of the 441 registries, mainly

in Brazil, China, India, and the USA. Among the 441 responding registries, staging data on breast, cervical, lung, colorectal, and prostate cancer are available in 78%, 75%, 71%, 76%, and 71%, respectively, of registries included in this volume. However, more detailed studies have shown that even if stage is recorded, this data item is often incomplete and is not included in the registry reports. About two thirds of responding registries record information on initial treatment.

The most basic patient-level variables (which are nearly always collected by high-quality population-based registries) are not included in Table 2.3, because they can be assumed to be recorded by all registries included in this volume. These universally recorded variables include name, sex, date of birth (or age), permanent residential address, incidence date (usually the date of diagnosis, hospitalization, or first treatment), and primary site and histological type of the cancer diagnosed – preferably coded according to the *International Classification of Diseases for Oncology* (ICD-O) schema (see Chapters 3 and 4).

Table 2.3 also indicates whether there is systematic vital status follow-up of registered patients. This is

essential for registries wishing to conduct survival analysis. Information is also provided about whether follow-up is carried out passively (by access to death certificates for all causes of death) and/or by active follow-up of live cases. Systematic vital status follow-up was done by 96% of the registries, by either passive or active follow-up or a combination of the two.

The last two columns of Table 2.3 indicate whether each registry follows any standard rules for recording incidence data and whether each registry can reliably identify subsequent primary cancers diagnosed in an individual previously diagnosed with an initial primary. Incidence date definitions in use were those of IARC/IACR (58% of responding registries included in this volume), the European Network of Cancer Registries (ENCR) (20%), and SEER (13%). Some of these recorded variables can provide information relevant to the care of cancer patients and the outcome of disease but are not used in this publication. If required for a specific research study, the data must be obtained from the individual registries.

Chapter 3: Classification and coding

Ariana Znaor, Brian Rous, and Jacques Ferlay

The *Cancer Incidence in Five Continents* (CI5) series has followed the evolution of the *International Classification of Diseases* (ICD) through four revisions, from the seventh revision (ICD-7) to the 10th (ICD-10), and the creation of a coding scheme for oncology: the *International Classification of Diseases for Oncology* (ICD-O) (WHO, 1976), now in its third edition (ICD-O-3) (Fritz et al., 2000). CI5 Volumes I (Doll et al., 1966) and II (Doll et al., 1970) presented data on cancer incidence coded to ICD-7 (WHO, 1957). Volume III (Waterhouse et al., 1976) published data using both ICD-7 and ICD-8 (WHO, 1967). ICD-8, which came into effect in 1968, was also used in Volume IV (Waterhouse et al., 1982). ICD-9 (WHO, 1977) was used for Volumes V (Muir et al., 1987), VI (Parkin et al., 1992), and VII (Parkin et al., 1997). ICD-10 (WHO, 1992) was used for Volumes VIII (Parkin et al., 2002), IX (Curado et al., 2007), X (Forman et al., 2014), and XI (Bray et al., 2017).

The updates to ICD-10 (2010 version; WHO, 2010) and the 2011 revision of ICD-O-3 (WHO, 2013) were considered in this volume, which presents data for the 5-year period of 2013–2017. The data are published at the level of the three-character ICD-10 codes in the individual registry tables. The groupings of ICD codes adopted in the previous four volumes of CI5 have been used again in this volume to maintain comparability over time. Table 3.1 presents the individual ICD-10 site codes, the full ICD-10 titles, the Volume XII groupings, and the short titles used in the incidence tables.

UPDATES OF ICD-10 AND ICD-O-3

The update of ICD-10 introduced in 2010 resulted in changes for the neoplasm chapter that affected the “Malignant neoplasms, stated or presumed to be primary, of lymphoid, haematopoietic and related tissue (C81–C96)” group. Mainly, a new three-digit category C86 “Other specified types of T/NK-cell lymphoma” and several new four-digit codes were added to the existing ones, in particular the new code C88.4 “Extranodal marginal zone B-cell lymphoma of mucosa-associated lymphoid tissue [MALT-lymphoma], Lymphoma of skin-associated lymphoid tissue (SALT-lymphoma), and Lymphoma of bronchial-associated lymphoid tissue (BALT-lymphoma)”. These diagnoses were previously included within the ICD-10 (1990) category C82.7 in CI5 Volume X. The 2011 revision of ICD-O-3 affected the morphology numerical list only, introducing new terms that have appeared in the recent literature, particularly in the “Lymphoma and leukaemia” group. Therefore, a new conversion table from the first (2011) revision of ICD-O-3 to ICD-10 (2010 version) for the ICD-O-3

morphology codes 9590/3 to 9992/3 had to be developed (see Table 3.2). In 2019, the second revision of the ICD-O-3 morphology codes was published online on the IACR website (<http://www.iacr.com.fr/>). The fourth edition (ICD-O-4) is currently in preparation and is planned for publication in 2025. ICD-11 (WHO, 2019) was endorsed in 2019 and came into effect in 2022. Therefore, these classification updates are not applicable to the data period presented in this volume.

CLASSIFICATIONS USED IN THE CANCER REGISTRY

Data submitted for the first four volumes of CI5 were sent in tabular format – organized by sex, site, and 5-year age group – on tape, diskette, or (most commonly) forms specifically designed for the purpose. The only verification possible was to tally the columns and rows. For Volume V, registries were given the option of sending data in the form of a case listing coded to ICD-9 topography only, or to ICD-9 or ICD-O topography plus ICD-O morphology. Only a very small minority of registries sent data coded to ICD-O. Contributors to Volume VI were encouraged to send data as a listing of individual cases, but 24% still sent tabulated data. Starting from Volume VII, data had to be sent as a listing of individual cases. Since the publication in 1976 of the first edition of ICD-O – which clearly defined axes of anatomical location, histology, and behaviour – international conformity to standard classification systems and coding rules has increased steadily. For data published in Volume IV (1973–1977), 90% of registries recorded histological diagnosis. For coding, just more than one third of the registries used the American Cancer Society’s *Manual of Tumor Nomenclature and Coding* (MOTNAC) (ACS, 1951, 1968), one third had started to use ICD-O, and 12% used the *Systematized Nomenclature of Pathology* (SNOP) (CAP, 1965). About 75% of contributors to Volume V used ICD-O to code histology, and that proportion rose to more than 90% for Volumes VI and VII. A total of 182 of the 186 contributors to Volume VIII, 224 of the 225 contributors to Volume IX, 288 of the 290 contributors to Volume X, and all of the contributors to Volume XI and the present volume coded their histological data to ICD-O. Although most of the data submitted for this volume had been coded or converted to ICD-O-3 (see Chapter 6), registries were also asked what classification systems were used for coding data in the registry during the period. Of the 460 registries that contributed, almost all coded to ICD-O-3 topography and morphology.

COMPARABILITY

All data supplied for this volume either were already coded to ICD-O-3 when submitted or were converted by IARC to ICD-O-3 for checking and were then converted to ICD-10 for presentation (see Chapter 6). This process ensures that the same validity checks and multiple primary rules are applied to all data, and that the final ICD-10 codes used in this publication follow a standard ICD-O-3 to ICD-10 (2010 version) conversion. When a dataset included an ICD-10 code, this was ignored in the tabulations. The ICD-O-3 to ICD-10 conversion program was written at IARC using the rules of the ICD-O-2 to ICD-10 conversion program developed by Percy (1998). The conversions strictly follow the ICD-10 coding rules, as expressed in the instruction manual of ICD-10 Volume 2 (Percy et al., 1990) or in the alphabetical index of ICD-10 Volume 3.

Theoretically, the use of a standard, well-designed coding system such as ICD should make the analysis and tabulation of comparable results a simple matter. But in practice, it has been a continual exercise in detection for the editors of CI5 to establish exactly how registries code various cancers. For the present volume, registries were asked whether any malignant diagnoses were excluded from their data, and how they coded intraductal carcinoma of breast, NOS; ductal and lobular carcinoma in situ of breast; ovarian cystadenoma of borderline malignancy; borderline tumour of ovary; benign tumours of brain and nervous system; and in situ and unspecified carcinoma of bladder (see Table 3.3).

Non-melanoma skin cancer

The incidence of non-melanoma skin cancer (NMSC) is difficult to assess. These cancers are very common and are rarely fatal, and the completeness of their registration varies widely depending on access to outpatient and general practitioners' records. Most NMSCs are basal cell carcinomas (BCCs) or squamous cell carcinomas (SCCs); other skin cancers are rare. Although some registries record the first occurrence of all NMSC, others register SCC only, and many do not collect data on either SCC or BCC.

Bladder cancer

The issue of coding non-invasive tumours (taking into account the recorded level of invasion and grade) – and which to include in the tables as “cancer of the bladder” – has long been a subject of debate. In CI5 Volume VI, it was decided, for the sake of geographical comparability, to exclude tumours of benign, in situ, and unspecified behaviour. In principle, the availability of data as individual case listings with histological type and behaviour should make it possible to publish only data on malignant cancer, by excluding diagnoses with any behaviour code other than /3. But when registries were asked about the behaviour codes they used for non-invasive and unspecified diagnoses of malignant bladder cancer for Volume VII, many of them reported that they assigned

the behaviour code /3 to both in situ and unspecified diagnoses, making it impossible to distinguish such cases. As a result, the editors decided to accept that non-invasive diagnoses of bladder cancer are generally considered malignant by pathologists; therefore, since Volume VII, the bladder cancer rubric (ICD-10 C67) has included the in situ (ICD-10 D09.0) and unspecified (ICD-10 D41.4) categories. In this volume, whenever possible, the inclusion of neoplasms of uncertain or unknown behaviour together with invasive cancers is indicated by a dagger symbol (†) beside C67 in the tables, and a note under the heading “Notes on the data” in the accompanying text. A few registries preferred not to include such cases in their dataset, even when available in the registry, for the sake of continuity over time.

Breast cancer

Intraductal carcinoma, ductal carcinoma in situ (DCIS), and lobular carcinoma in situ of breast are classified in ICD-O-3 as in situ cancers (behaviour code /2).

Ovarian cancer

The registries contributing to this volume were asked how they coded ovarian cystadenoma of borderline malignancy and borderline tumour of ovary. Borderline ovarian diagnoses are classified as non-malignant tumours in ICD-O-3 (behaviour code /1) and are excluded from the tabulations, but a few registries still code them as malignant neoplasms.

Brain and central nervous system

Many registries choose to include benign and unspecified tumours of the brain and central nervous system in their data, because of the potentially serious clinical consequences of these tumours. Before Volume VII, such tumours may therefore have been included in the tables along with cancers of the brain and nervous system. However, the proportion of such cases varies widely between registries, so since Volume VII they are no longer included.

Myeloproliferative disorders and myelodysplastic syndromes

These include records with the ICD-O-3 morphological codes 9950/3, 996_/3, 9971/3, 9975/3, 998_/3, and 999_/3. Only registries that originally coded their data to ICD-O-3 can report such diagnoses, because they were not considered malignant tumours in ICD-O-2 (behaviour code /1). These codes are converted to the ICD-10 codes D45, D46_, and D47_ by the IARC ICD-O-3 to ICD-10 conversion program (except M9966/3, M9967/3, and M9984/3, which are converted to ICD-10 C92.7, C96.7, and C92.0, respectively; see Table 3.2) and are presented in two separate categories in the tables – “Myeloproliferative disorders (MPD)” and “Myelodysplastic syndromes (MDS)” – and also included in the “All sites (C00–96)” category (see Table 3.1).

Table 3.1. Classifications used in the incidence tables in C15 Volume XII

| ICD-10 (2010 version) site code | Full ICD-10 title | Grouping used in tables | Short title used in tables |
|---------------------------------------|--|--|-----------------------------|
| C00 | Malignant neoplasm of lip | – | Lip |
| C01 | Malignant neoplasm of base of tongue | C01–C02 are grouped | Tongue |
| C02 | Malignant neoplasm of other and unspecified parts of tongue | | |
| C03 | Malignant neoplasm of gum | C03–C06 are grouped | Mouth |
| C04 | Malignant neoplasm of floor of mouth | | |
| C05 | Malignant neoplasm of palate | | |
| C06 | Malignant neoplasm of other and unspecified parts of mouth | | |
| C07 | Malignant neoplasm of parotid gland | C07–C08 are grouped | Salivary glands |
| C08 | Malignant neoplasm of other and unspecified major salivary glands | | |
| C09 | Malignant neoplasm of tonsil | – | Tonsil |
| C10 | Malignant neoplasm of oropharynx | – | Other oropharynx |
| C11 | Malignant neoplasm of nasopharynx | – | Nasopharynx |
| C12 | Malignant neoplasm of pyriform sinus | C12–C13 are grouped | Hypopharynx |
| C13 | Malignant neoplasm of hypopharynx | | |
| C14 | Malignant neoplasm of other and ill-defined sites in the lip, oral cavity and pharynx | – | Pharynx unspecified |
| C15 | Malignant neoplasm of oesophagus | – | Oesophagus |
| C16 | Malignant neoplasm of stomach | – | Stomach |
| C17 | Malignant neoplasm of small intestine | – | Small intestine |
| C18 | Malignant neoplasm of colon | – | Colon |
| C19 | Malignant neoplasm of rectosigmoid junction | C19–C20 are grouped | Rectum |
| C20 | Malignant neoplasm of rectum | | |
| C21 | Malignant neoplasm of anus and anal canal | – | Anus |
| C22 | Malignant neoplasm of liver and intrahepatic bile ducts | – | Liver |
| C23 | Malignant neoplasm of gallbladder | C23–C24 are grouped | Gallbladder etc. |
| C24 | Malignant neoplasm of other and unspecified parts of biliary tract | | |
| C25 | Malignant neoplasm of pancreas | – | Pancreas |
| C26 | Malignant neoplasm of other and ill-defined digestive organs | C26 is included in other and unspecified | |
| C30 | Malignant neoplasm of nasal cavity and middle ear | C30–C31 are grouped | Nose, sinuses etc. |
| C31 | Malignant neoplasm of accessory sinuses | | |
| C32 | Malignant neoplasm of larynx | – | Larynx |
| C33 | Malignant neoplasm of trachea | C33–C34 are grouped | Trachea, bronchus, and lung |
| C34 | Malignant neoplasm of bronchus and lung | | |
| C37 | Malignant neoplasm of thymus | C37–C38 are grouped | Other thoracic organs |
| C38 | Malignant neoplasm of heart, mediastinum and pleura | | |
| C39 | Malignant neoplasm of other and ill-defined sites in the respiratory system and intrathoracic organs | C39 is included in other and unspecified | |
| C40 | Malignant neoplasm of bone and articular cartilage of limbs | C40–C41 are grouped | Bone |
| C41 | Malignant neoplasm of bone and articular cartilage of other and unspecified sites | | |
| C43 | Malignant melanoma of skin | – | Melanoma of skin |
| C44 | Other malignant neoplasms of skin | – | Other skin |
| C45 | Mesothelioma | – | Mesothelioma |
| C46 | Kaposi sarcoma | – | Kaposi sarcoma |
| C47 | Malignant neoplasm of peripheral nerves and autonomic nervous system | C47 is grouped with C49 | Connective and soft tissue |
| C48 | Malignant neoplasm of retroperitoneum and peritoneum | C48 is included in other and unspecified | |
| C49 | Malignant neoplasm of other connective and soft tissue | C49 is grouped with C47 | |
| C50 | Malignant neoplasm of breast | – | Breast |
| C51 | Malignant neoplasm of vulva | – | Vulva |
| C52 | Malignant neoplasm of vagina | – | Vagina |

Table 3.1. (Contd) Classifications used in the incidence tables in CI5 Volume XII

| ICD-10 (2010 version) site code | Full ICD-10 title | Grouping used in tables | Short title used in tables |

| C53 | Malignant neoplasm of cervix uteri | – | Cervix uteri |
| C54 | Malignant neoplasm of corpus uteri | – | Corpus uteri |
| C55 | Malignant neoplasm of uterus, part unspecified | – | Uterus unspecified |
| C56 | Malignant neoplasm of ovary | – | Ovary |
| C57 | Malignant neoplasm of other and unspecified female genital organs | – | Other female genital organs |
| C58 | Malignant neoplasm of placenta | – | Placenta |
| C60 | Malignant neoplasm of penis | – | Penis |
| C61 | Malignant neoplasm of prostate | – | Prostate |
| C62 | Malignant neoplasm of testis | – | Testis |
| C63 | Malignant neoplasm of other and unspecified male genital organs | – | Other male genital organs |
| C64 | Malignant neoplasm of kidney, except renal pelvis | – | Kidney |
| C65 | Malignant neoplasm of renal pelvis | – | Renal pelvis |
| C66 | Malignant neoplasm of ureter | – | Ureter |
| C67 | Malignant neoplasm of bladder | – | Bladder |
| C68 | Malignant neoplasm of other and unspecified urinary organs | – | Other urinary organs |
| C69 | Malignant neoplasm of eye and adnexa | – | Eye |
| C70 | Malignant neoplasm of meninges | C70–C72 are grouped | Brain and nervous system |
| C71 | Malignant neoplasm of brain | | |
| C72 | Malignant neoplasm of spinal cord, cranial nerves and other parts of central nervous system | | |
| C73 | Malignant neoplasm of thyroid gland | – | Thyroid |
| C74 | Malignant neoplasm of adrenal gland | – | Adrenal gland |
| C75 | Malignant neoplasm of other endocrine glands and related structures | – | Other endocrine |
| C76 | Malignant neoplasm of other and ill-defined sites | C76 is included in other and unspecified | |
| C80 | Malignant neoplasm without specification of site | C80 is included in other and unspecified | |
| C81 | Hodgkin lymphoma | – | Hodgkin lymphoma |
| C82 | Follicular lymphoma | C82–C86 and C96 are grouped | Non-Hodgkin lymphoma |
| C83 | Non-follicular lymphoma | | |
| C84 | Mature T/NK-cell lymphomas | | |
| C85 | Other and unspecified types of non-Hodgkin lymphoma | | |
| C86 | Other specified types of T/NK-cell lymphoma | | |
| C88 | Malignant immunoproliferative diseases | – | Immunoproliferative diseases |
| C90 | Multiple myeloma and malignant plasma cell neoplasms | – | Multiple myeloma |
| C91 | Lymphoid leukaemia | – | Lymphoid leukaemia |
| C92 | Myeloid leukaemia | C92–C94 are grouped (following ICD-O-3) | Myeloid leukaemia |
| C93 | Monocytic leukaemia | | |
| C94 | Other leukaemias of specified cell type | | |
| C95 | Leukaemia of unspecified cell type | – | Leukaemia unspecified |
| C96 | Other and unspecified malignant neoplasms of lymphoid, haematopoietic and related tissue | C96 is grouped with C82–C86 | |
| O&U | Other and unspecified | Includes C26, C39, C48, C76, and C80 | Other and unspecified |
| MPD | Myeloproliferative disorders | Includes ICD-O-3 M9950/3, M9960–9965/3, M9971/3, and M9975/3 | Myeloproliferative disorders |
| MDS | Myelodysplastic syndromes | Includes ICD-O-3 M9980–9983/3, M9985–9989/3, M9991/3, and M9992/3 | Myelodysplastic syndromes |
| C00–96* | | | All sites |
| C00–96* exc. C44 | | | All sites except C44 |

*Includes O&U, MPD, and MDS site codes

Table 3.2. Conversion of lymphoid and haematopoietic diseases (ICD-O-3 M9590–M9992)

| ICD-O-3 (first revision) code | Full ICD-O-3 title | ICD-10 (2010 version) site code |

Chapter 4: Histological groups

Ariana Znaor, Jacques Ferlay, and Brian Rous

BACKGROUND

The data presented in this volume of *Cancer Incidence in Five Continents (CI5)* cover the period 2013–2017 and are mainly organized by the predominantly site-based categories of Chapter II (Neoplasms) of the 10th revision of the *International Classification of Diseases (ICD-10, 2010 version; WHO, 2010)* (see Chapter 3 of this volume). However, for some sites of cancer, the histological type is particularly relevant clinically and/or epidemiologically. In the present volume, the data are grouped according to the same histological types as used in CI5 Volume XI (Bray et al., 2017) and listed in this chapter.

GENERAL STRUCTURE

The main structure of the histological grouping is that specific types of malignant neoplasms are listed, as well as the category “Unspecified malignant neoplasm” (i.e. malignant tumours that are so poorly differentiated that we are unable to classify them into major groups such as carcinoma or sarcoma, or for which the registry does not have specific information on the tumour). Neoplasms that have a specific morphology but are too rare to be listed among the major histological groups are grouped together in the category “Other specified malignant neoplasm”. Similarly, in the category “Carcinoma”, specific subtypes, such as “Squamous cell carcinoma” and “Adenocarcinoma”, are listed, as well as “Unspecified carcinoma” (i.e. carcinomas that are so poorly differentiated that we are unable to classify them according to histological subtype, although it is still possible to distinguish them from non-epithelial malignant neoplasms, such as sarcoma). Morphological codes are listed for the specific types of neoplasm (or carcinoma), and for “Unspecified malignant neoplasm” (or carcinoma). The remaining codes of neoplasia (or carcinoma) are then automatically assigned to the “Other specified malignant neoplasm” (or carcinoma) category.

SITES

For inclusion in CI5 as a distinct histological type within a site group, a type must be both sufficiently common at the site and clinically epidemiologically relevant. The following 15 organ sites are included in this chapter, with accompanying histological type information: oesophagus, anus, liver, lung, bone, skin, cervix uteri, corpus uteri, ovary, testis, kidney and renal pelvis, urinary bladder, eye, brain and central nervous system,

and thyroid, as well as haematological malignancies. Some major cancer sites, such as breast and prostate, are not included, because most malignant neoplasms at these sites are adenocarcinomas, and the coding of adenocarcinoma subtypes is not consistent. Kidney was combined with renal pelvis because some urothelial carcinomas originating from the renal pelvis are site coded as kidney cancers, whereas others are coded as renal pelvis cancers. Hodgkin lymphoma and leukaemias are combined together in the haematological group.

TYPES OF NEOPLASMS INCLUDED

The CI5 Volume XII data include all invasive malignant neoplasms and some non-invasive malignant neoplasms (see Chapter 3). For most morphology codes, a fifth digit of /1 or /2 automatically excludes data entry. Carcinoma in situ is reported by many cancer registries but is not generally dealt with in this volume, with the exception of urothelial carcinoma in situ. A few lesions of borderline malignancy are included, such as low-grade non-invasive papillary transitional cell tumours, which are now designated as papillary urothelial neoplasia of low malignant potential (PUNLMP) (8130/1). Flat carcinoma in situ of the urothelium (8120/2) and PUNLMP (8130/1, 8130/2) have been grouped with transitional cell carcinoma in this volume. Because skin has been included, basal cell carcinoma is reported as a separate group, although many cancer registries do not have statistics on these tumours. Within the 15 organ sites presented, there are no cases of mesothelioma (ICD-O M905_), Kaposi sarcoma (9140), lymphoma, or leukaemia (9590–9992), because these cancers have their own specific ICD-10 codes and are presented separately in this volume.

MORPHOLOGY CODES

The grouping of morphology codes presents several difficulties. The ICD-O system is based on separate site (topography) and morphology (histology) codes that can be combined. Inevitably, in cancer registry data, morphology codes are sometimes mistakenly combined with codes for sites where these entities do not occur or have not been reported. Some morphology codes are redundant (i.e. multiple codes can be applied for the same tumour). Other codes are obsolete (i.e. the entities have been renamed or deleted in later revisions of tumour classifications). A major difficulty is the variation in coding precision (specific codes for

tumour subtypes vs comprehensive codes for broad categories such as adenocarcinoma), which limits the utility of detailed codes. An example of this is kidney tumours. Renal cell carcinomas are often coded as renal cell carcinoma, not otherwise specified (NOS) (8312) or adenocarcinoma, NOS (8140), whereas others are subtyped. Therefore, all carcinomas of the kidney are grouped together in this chapter.

Some cancer types occur in several organs but have different clinical behaviour depending on the site of origin. For most sites, adenosquamous carcinoma (8560) and mucoepidermoid carcinoma (8430) are included in the category “Other specified carcinoma”. An exception is the corpus uteri (C54), where these are included in the category “Adenocarcinoma” because they are thought to have similar biology (Zaino and Kurman, 1988). Furthermore, squamous differentiation is very common in endometrioid carcinoma (8380–8383), which makes it difficult to differentiate between these tumours. Another example is metaplastic carcinoma (8575), which is generally included in the category “Other specified carcinoma”. However, for the corpus uteri, it is included in the category “Other specified malignant neoplasm”, because metaplastic carcinoma is considered equivalent to carcinosarcoma at this site (Silverberg et al., 1990).

The “Unspecified carcinoma” category includes tumours that are coded as carcinoma, NOS, but also some descriptive diagnoses of poorly differentiated

cancers. These tumours can be recognized as carcinomas but are too undifferentiated to be further classified according to their histogenetic origin. This group generally includes the morphology codes 8010–8035. An exception is the lung, where “Large cell carcinoma” is a separate category in the WHO classification, and includes the morphology codes 8010–8012, 8014–8031, and 8035 (Travis et al., 2004). Another exception is the thyroid, where “Anaplastic carcinoma” is also a specific category in the WHO classification, and includes the morphology codes 8020–8035 (DeLellis et al., 2004).

Some tumours are evidently miscoded in cancer registry data, because their incidence is far higher than expected. Papillary carcinoma, NOS is listed in the category “Squamous cell neoplasm” in ICD-O-3 (Fritz et al., 2000). Most bladder tumours for which this code is used are probably miscoded urothelial carcinomas rather than papillary squamous cell carcinomas, and they are therefore included in the “Transitional cell carcinoma” category. In the thyroid, it can be assumed that carcinomas assigned to the morphology code 8050 are actually papillary carcinomas of the thyroid, and they are therefore included in that category. In the kidney, it can be assumed that the majority of tumours with the morphology code 8050 are miscoded papillary renal cell carcinomas, and they are therefore included in the “Renal cell carcinoma” category.

OESOPHAGUS (C15)

The “Adenocarcinoma” category excludes linitis plastica (8142), which occurs in the gastric epithelium. The “Squamous cell carcinoma” category includes basaloid squamous cell carcinoma (8083). The principal cancers in the “Other specified carcinoma”

category are large cell carcinoma (8012–8014) and small cell carcinoma (8041–8045). Melanoma and carcinosarcoma are included in the category “Other specified malignant neoplasm”.

Table 4.1. Oesophagus (C15)

| | |
|---|---|
| 1 Carcinoma | 8010–8576 |
| 1.1 Squamous cell carcinoma | 8050–8078, 8083–8084 |
| 1.2 Adenocarcinoma | 8140–8141, 8143–8145, 8190–8231, 8260–8265, 8310, 8401, 8480–8490, 8550–8552, 8570–8574, 8576 |
| 1.3 Other specified carcinoma | |
| 1.4 Unspecified carcinoma | 8010–8035 |
| 2 Sarcoma | 8800–8811, 8830, 8840–8921, 8990–8991, 9040–9044, 9120–9133, 9150, 9540–9581 |
| 3 Other specified malignant neoplasm | |
| 4 Unspecified malignant neoplasm | 8000–8005 |

ANUS (C21)

The category “Squamous cell carcinoma” includes basaloid and cloacogenic carcinomas (8123–8124) and basaloid squamous cell carcinoma (8083). Cloacogenic carcinoma is a controversial entity, sometimes defined as carcinoma arising from the anal transition zone, and sometimes as a morphological variant of squamous

cell carcinoma. The term “basaloid carcinoma” has also been used to designate this group of tumours. Their reported incidence is highly variable, possibly because of the confusing nomenclature. Hence, these tumour types are included in the category “Squamous cell carcinoma”.

Table 4.2. Anus (C21)

| | |
|---|--|
| 1 Carcinoma | 8010–8576 |
| 1.1 Squamous cell carcinoma | 8050–8076, 8083–8084, 8123–8124 |
| 1.2 Adenocarcinoma | 8140–8145, 8190–8231, 8260–8265, 8310, 8401, 8480–8490, 8550–8552, 8570–8574, 8576 |
| 1.3 Other specified carcinoma | |
| 1.4 Unspecified carcinoma | 8010–8011 |
| 2 Melanoma | 8720–8790 |
| 3 Other specified malignant neoplasm | |
| 4 Unspecified malignant neoplasm | 8000–8005 |

LIVER (C22)

The category “Hepatocellular carcinoma” includes hepatoid carcinomas (8576), under the assumption that these are actually miscoded hepatocellular carcinomas. The category “Cholangiocarcinoma” encompasses all primary carcinomas of the liver of biliary epithelial type

(i.e. it excludes hepatocellular carcinoma and combined hepatocellular and cholangiocarcinoma). Combined hepatocellular and cholangiocarcinoma (8180) is included in the “Other specified carcinoma” category, as are carcinoids.

Table 4.3. Liver and intrahepatic bile ducts (C22)

| | |
|--|---|
| 1 Carcinoma | 8010–8576 |
| 1.1 Hepatocellular carcinoma | 8170–8175 |
| 1.2 Cholangiocarcinoma (all intrahepatic biliary carcinomas, i.e. all primary adenocarcinomas) | 8050, 8140–8141, 8160–8161, 8260, 8440, 8480–8500, 8570–8572 |
| 1.3 Other specified carcinoma | |
| 1.4 Unspecified carcinoma | 8010–8035 |
| 2 Hepatoblastoma | 8970 |
| 3 Sarcoma | |
| 3.1 Haemangiosarcoma | 9120–9133, 9161 |
| 3.2 Other sarcomas | 8800–8811, 8830, 8840–8921, 8990–8991, 9040–9044, 9150, 9170, 9540–9581 |
| 4 Other specified malignant neoplasm | |
| 5 Unspecified malignant neoplasm | 8000–8005 |

LUNG (C34)

The “Squamous cell carcinoma” category includes papillary carcinoma, NOS (8050), because this is listed under “Squamous cell neoplasm” in ICD-O-3. The category “Adenocarcinoma” includes bronchioloalveolar adenocarcinoma (8250–8254) but excludes adenoid cystic (8200), mucoepidermoid (8430), and adenosquamous (8560) carcinomas, which are instead included in the category “Other specified carcinoma”. The category “Large cell carcinoma” includes cancers

so described (8012), as well as other morphological variants of undifferentiated carcinomas (except those with neuroendocrine or spindle cell differentiation) and clear cell adenocarcinoma (8310). The category “Other specified carcinoma” includes non-small cell carcinoma (8046); carcinoid tumours (8240–8245); and adenoid cystic (8200), mucoepidermoid (8430), adenosquamous (8560), and large cell neuroendocrine (8013) carcinomas.

Table 4.4. Lung (C34)

| | |
|---|---|
| 1 Carcinoma | 8010–8576 |
| 1.1 Squamous cell carcinoma | 8050–8078, 8083–8084 |
| 1.2 Adenocarcinoma | 8140, 8211, 8230–8231, 8250–8260, 8323, 8480–8490, 8550–8552, 8570–8574, 8576 |
| 1.3 Small cell carcinoma | 8041–8045 |
| 1.4 Large cell carcinoma (including giant cell, clear cell and large cell undifferentiated carcinoma) | 8010–8012, 8014–8031, 8035, 8310 |
| 1.5 Other specified carcinoma | |
| 2 Sarcoma | 8800–8811, 8830, 8840–8921, 8990–8991, 9040–9044, 9120–9133, 9150, 9540–9581 |
| 3 Other specified malignant neoplasm | |
| 4 Unspecified malignant neoplasm | 8000–8005 |

BONE (C40–C41)

The main categories are “Osteosarcoma”, “Chondrosarcoma”, and “Ewing sarcoma”. These three groups encompass the same ICD-O entities as groups VIII A–C in the third edition of *International Classification of Childhood Cancer* (Steliarova-Foucher et al., 2005). The “Other specified sarcoma” category includes epithelioid sarcoma (8804), fibrosarcoma (8810–8812), malignant fibrous histiocytoma (8830), liposarcomas

(8850–8858), angiosarcomas (9120–9133), and malignant giant cell tumours (9250). The “Other specified malignant neoplasm” category includes desmoplastic small round cell tumour (8806), mesenchymoma (8990), chordoma (9370–9372), adamantinomas (9261, 9310), and primitive neuroectodermal tumour (PNET) (9473).

Table 4.5. Bone (C40–C41)

| | |
|---|--|
| 1 Sarcoma | 8800–8921, 9040–9044, 9120–9133, 9150, 9180–9250, 9260, 9540–9581 |
| 1.1 Osteosarcoma | 9180–9200 |
| 1.2 Chondrosarcoma | 9210–9243 |
| 1.3 Ewing sarcoma | 9260 |
| 1.4 Other specified sarcoma | |
| 1.5 Unspecified sarcoma | 8800–8803, 8805 |
| 2 Other specified malignant neoplasm | |
| 3 Unspecified malignant neoplasm | 8000–8005 |

SKIN (C43-C44)

Basal cell carcinoma is registered and reported by several cancer registries and has therefore been included.

Table 4.6. Skin (C43-C44)

| | | |
|----------|---|----------------------|
| 1 | Carcinoma | 8010-8576 |
| 1.1 | Squamous cell carcinoma | 8050-8078, 8083-8084 |
| 1.2 | Basal cell carcinoma | 8090-8098 |
| 1.3 | Other specified carcinoma | |
| 1.4 | Unspecified carcinoma | 8010-8035 |
| 2 | Melanoma | 8720-8790 |
| 3 | Other specified malignant neoplasm | |
| 4 | Unspecified malignant neoplasm | 8000-8005 |

CERVIX UTERI (C53)

Mucoepidermoid carcinoma (8430) and adenosquamous carcinoma (8560) are included in the category "Other specified carcinoma". The "Other specified malignant neoplasm" category includes Mullerian mixed

tumour (8950), carcinosarcoma (8980), and melanoma (8720-8790). Malignant endometrioid adenofibroma (8381) is also classified as "Other specified malignant neoplasm".

Table 4.7. Cervix uteri (C53)

| | | |
|----------|---|---|
| 1 | Carcinoma | 8010-8380, 8382-8576 |
| 1.1 | Squamous cell carcinoma | 8050-8078, 8083-8084 |
| 1.2 | Adenocarcinoma | 8140-8141, 8190-8211, 8230-8231, 8260-8265, 8310, 8380, 8382-8384, 8440-8490, 8570-8574, 8576 |
| 1.3 | Other specified carcinoma | |
| 1.4 | Unspecified carcinoma | 8010-8035 |
| 2 | Sarcoma | 8800-8811, 8830, 8840-8921, 8990-8991, 9040-9044, 9120-9133, 9150, 9540-9581 |
| 3 | Other specified malignant neoplasm | |
| 4 | Unspecified malignant neoplasm | 8000-8005 |

CORPUS UTERI (C54)

Squamous cell carcinomas are included in the category “Other specified carcinoma” because of their rarity at this site. Unlike for other sites, mucoepidermoid (8430) and adenosquamous (8569) carcinomas are included in the category “Adenocarcinoma”, because squamous differentiation is very common in adenocarcinoma of the corpus uteri, and it is assumed that partial squamous

differentiation does not change the behaviour of these neoplasms. Also, unlike for other sites, metaplastic carcinoma (8575) is included in the category “Other specified malignant neoplasm”, because in the corpus uteri, metaplastic carcinoma of the endometrium has been equated with carcinosarcoma.

Table 4.8. Corpus uteri (C54)

| | |
|---|---|
| 1 Carcinoma | 8010–8574, 8576 |
| 1.1 Adenocarcinoma (including mucoepidermoid and adenosquamous carcinoma) | 8140–8141, 8190–8211, 8230–8231, 8260–8265, 8310, 8380, 8382–8384, 8430, 8440–8490, 8510, 8560, 8569, 8570–8574, 8576 |
| 1.2 Other specified carcinoma | |
| 1.3 Unspecified carcinoma | 8010–8035 |
| 2 Sarcoma | 8800–8811, 8830, 8840–8921, 8990–8991, 9040–9044, 9120–9133, 9150, 9540–9581 |
| 3 Other specified malignant neoplasm | |
| 4 Unspecified malignant neoplasm | 8000–8005 |

OVARY (C56)

The first four carcinoma categories listed here correspond to malignant serous, mucinous, endometrioid, and clear cell tumours. Among the carcinomas not included in these four groups, there are various adenocarcinomas that cannot with certainty be allocated to any of the above-mentioned groups and are hence included in the category “Adenocarcinoma, NOS”. This category also includes papillary adenocarcinoma (8260), cystadenocarcinoma (8440), and other variants of adenocarcinoma. Within the category “Adenocarcinoma, NOS”, there are probably a

substantial number of tumours that actually belong to categories 1.1–1.4. Truly unclassified adenocarcinomas of the ovary are uncommon. Sex cord-stromal tumours have their own group. The category “Germ cell tumours” includes dysgerminomas, embryonal carcinomas, and teratomas, as well as the rare carcinoid tumours of the ovary and the very rare gonadoblastomas. Lipid cell tumours, malignant Brenner tumours, and sarcomas are very rare and are consigned to the category “Other specified malignant neoplasm”.

Table 4.9. Ovary (C56)

| | |
|--|---|
| 1 Carcinoma | 8010–8231, 8246–8576, 9014–9015, 9110 |
| 1.1 Serous carcinoma | 8441, 8460–8463, 9014 |
| 1.2 Mucinous carcinoma | 8470–8490, 9015 |
| 1.3 Endometrioid carcinoma | 8380–8383, 8560, 8570 |
| 1.4 Clear cell carcinoma | 8310–8313, 9110 |
| 1.5 Adenocarcinoma, NOS | 8140–8147, 8170–8190, 8211–8231, 8260, 8384, 8440, 8576 |
| 1.6 Other specified carcinoma | |
| 1.7 Unspecified carcinoma | 8010–8035 |
| 2 Sex cord-stromal tumours | 8590–8671 |
| 3 Germ cell tumours | 8240–8245, 9060–9102 |
| 4 Other specified malignant neoplasm (including Mullerian mixed tumour, carcinosarcoma) | |
| 5 Unspecified malignant neoplasm | 8000–8005 |

TESTIS (C62)

Spermatocytic seminoma has a more favourable prognosis than does seminoma, and these tumours should not be grouped together. Embryonal carcinoma, malignant teratoma, yolk sac tumour, choriocarcinoma,

and mixed germ cell tumours are included in the category “Non-seminomatous germ cell tumours”. Sex cord-stromal tumours are included in the category “Other specified malignant neoplasm”.

Table 4.10. Testis (C62)

| | |
|---|------------------|
| 1 Germ cell tumours | 9060–9102 |
| 1.1 Seminoma | 9060–9062, 9064 |
| 1.2 Spermatocytic seminoma | 9063 |
| 1.3 Non-seminomatous germ cell tumours | 9065–9102 |
| 2 Other specified malignant neoplasm | |
| 3 Unspecified malignant neoplasm | 8000–8005 |

KIDNEY (C64) AND RENAL PELVIS (C65)

There are several major difficulties with the histological grouping of kidney tumours. Transitional cell and squamous carcinomas in the kidney usually originate from the renal pelvis, although it may be difficult to trace the origin of the tumour. It can be assumed that some of these are site coded as kidney cancers (C64) and others as renal pelvis cancers (C65). Hence, these two sites are now grouped.

Renal cell carcinomas have recently undergone a reclassification based on molecular, cytogenetic, morphological, and clinical data. However, a substantial portion of these tumours are coded as renal cell

carcinoma, NOS (8312) or adenocarcinoma, NOS (8140), whereas others are subtyped. Therefore, the “Renal cell carcinoma” category includes adenocarcinoma, NOS (8140), specific subtypes of renal cell carcinoma, and also obsolete entities such as granular cell carcinoma (8320). Papillary carcinoma, NOS (8050) is listed under “Squamous cell neoplasm” in ICD-O-3. When this code is used for renal tumours, it is probably most often a miscoding of papillary renal cell carcinoma, and it is therefore included in the “Renal cell carcinoma” category as well.

Table 4.11. Kidney (C64) and renal pelvis (C65)

| | |
|---|---|
| 1 Carcinoma | 8010–8576 |
| 1.1 Squamous, transitional cell carcinoma | 8051–8084, 8120–8122, 8130–8131 |
| 1.2 Renal cell carcinoma | 8050, 8140, 8260, 8270, 8280–8312, 8316–8320, 8340–8344 |
| 1.3 Other specified carcinoma | |
| 1.4 Unspecified carcinoma | 8010–8035 |
| 2 Other specified malignant neoplasm | |
| 3 Unspecified malignant neoplasm | 8000–8005 |

URINARY BLADDER (C67)

The classification of urinary bladder tumours has undergone several revisions in recent years. Some low-grade papillary transitional cell tumours are now designated as PUNLMP (8130/1). To enable longitudinal comparisons, flat carcinoma in situ (8120/2) and PUNLMP (8130/1, 8130/2) have been included in the category “Transitional cell carcinoma”.

Papillary carcinoma, NOS (8050) is listed under “Squamous cell neoplasm” in ICD-O-3. When this code

is used for bladder tumours, it is probably most often a miscoding of transitional cell carcinoma, and it is therefore included in the “Transitional cell carcinoma” category. Pheochromocytoma, malignant paraganglioma, melanoma, and carcinosarcoma are included in the “Other specified malignant neoplasm” category.

Table 4.12. Urinary bladder (C67)

| | |
|--|---|
| 1 Carcinoma | 8010–8576 |
| 1.1 Squamous cell carcinoma | 8051–8078, 8083–8084 |
| 1.2 Transitional cell carcinoma (including transitional cell carcinoma with squamous and/or glandular differentiation) | 8050, 8120–8122, 8130–8131 |
| 1.3 Adenocarcinoma | 8140–8145, 8190–8231, 8260–8265, 8310, 8401, 8480–8490, 8550–8552, 8570–8574, 8576 |
| 1.4 Other specified carcinoma | |
| 1.5 Unspecified carcinoma | 8010–8035 |
| 2 Sarcoma | 8800–8811, 8830, 8840–8921, 8990–8991, 9040–9044, 9120–9133, 9150, 9540–9581 |
| 3 Other specified malignant neoplasm | |
| 4 Unspecified malignant neoplasm | 8000–8005 |

EYE (C69)

The principal eye cancers – retinoblastoma and malignant melanoma – form two categories. The carcinomas are divided into three subgroups: “Squamous cell carcinoma” (70% of the carcinomas, principally tumours of the conjunctiva and cornea), “Other specified carcinoma” (14.6% of the carcinomas,

comprising almost entirely adenocarcinomas and mainly originating in the lacrimal gland and duct), and “Unspecified carcinoma”. Squamous cell carcinomas that are site coded for the eye (C69) probably include some cancers that originate in the skin (C44) of the eyelids.

Table 4.13. Eye (C69)

| | |
|---|---|
| 1 Retinoblastoma | 9510–9513 |
| 2 Malignant melanoma | 8720–8790 |
| 3 Carcinoma | 8010–8576 |
| 3.1 Squamous cell carcinoma | 8050–8078, 8083–8084 |
| 3.2 Other specified carcinoma | |
| 3.3 Unspecified carcinoma | 8010–8035 |
| 4 Sarcoma | 8800–8811, 8830, 8840–8921, 8990–8991, 9040–9044, 9120–9133, 9150, 9540–9581 |
| 5 Other specified malignant neoplasm | |
| 6 Unspecified malignant neoplasm | 8000–8005 |

BRAIN AND CENTRAL NERVOUS SYSTEM (C71-C72)

These categories are based on those of the WHO *Pathology and Genetics of Tumours of the Nervous System* classification (Kleihues and Cavenee, 1997). Atypical teratoid/rhabdoid tumour (9508) is included in the “Embryonal tumours” category. The “Other neuroepithelial tumours” category includes

olfactory, pineal, and some pituitary tumours, such as craniopharyngioma (9350–9352); pinealoma, pineocytoma, and pineoblastoma (9360–9362); papillary tumour of the pineal region (9395); and olfactory neuroepitheliomatous neoplasms (9520–9523).

Table 4.14. Brain and central nervous system (C71-C72)

| | |
|--|--|
| 1 Tumours of neuroepithelial tissue | 8680, 9350–9362, 9380–9508, 9520–9523 |
| 1.1 Gliomas | 9380–9384, 9391–9460 |
| 1.1.1 Astrocytic tumours | 9384, 9400–9421, 9424–9425, 9440–9442 |
| 1.1.2 Oligodendroglial tumours and mixed gliomas | 9382, 9450–9451 |
| 1.1.3 Ependymal tumours | 9383, 9391–9394 |
| 1.1.4 Gliomas, others | 9380–9381, 9423, 9430, 9444, 9460 |
| 1.2 Embryonal tumours | 9470–9474, 9490, 9500–9504, 9508 |
| 1.2.1 Medulloblastoma | 9470–9472, 9474 |
| 1.2.2 Other | 9473, 9490, 9500–9504, 9508 |
| 1.3 Other neuroepithelial tumours | |
| 2 Other specified malignant neoplasm | |
| 3 Unspecified malignant neoplasm | 8000–8005 |

THYROID (C73)

Follicular and papillary carcinomas constitute the majority of thyroid cancers. The “Papillary carcinoma” category includes follicular carcinomas with a papillary component (8340). It is assumed that most cases of papillary squamous carcinoma (8050) are actually papillary carcinomas, and they are therefore included in this category as well. Squamous carcinoma is no longer recognized as a major histological type in the WHO classification, and it is therefore included in the category “Other specified carcinoma”.

“Anaplastic carcinoma” (encompassing undifferentiated, giant cell, and spindle cell carcinomas) is a

separate category from “Unspecified carcinoma”. Poorly differentiated carcinoma is a controversial entity and has been classified under “Anaplastic carcinoma”. Small cell carcinoma (8040–8045) is specifically excluded, because the great majority of tumours previously so diagnosed are in fact lymphomas.

Insular thyroid carcinoma (8337) is a distinctive clinicopathological entity that has been included in the “Other specified carcinoma” category. Mixed medullary-follicular carcinoma (8346) and mixed medullary-papillary carcinoma (8347) are also included in this category.

Table 4.15. Thyroid (C73)

| | |
|---|---|
| 1 Carcinoma | 8010–8576 |
| 1.1 Follicular carcinoma | 8290, 8330–8335 |
| 1.2 Papillary carcinoma | 8050, 8260, 8340–8344, 8350, 8450–8460 |
| 1.3 Medullary carcinoma | 8345, 8510–8513 |
| 1.4 Anaplastic carcinoma | 8020–8035 |
| 1.5 Other specified carcinoma | |
| 1.6 Unspecified carcinoma | 8010–8015 |
| 2 Sarcoma | 8800–8811, 8830, 8840–8921, 8990–8991, 9040–9044, 9120–9133, 9150, 9540–9581 |
| 3 Other specified malignant neoplasm | |
| 4 Unspecified malignant neoplasm | 8000–8005 |

**HAEMATOPOIETIC AND LYMPHOID TISSUES
(9590–9992)**

The category “Non-Hodgkin lymphoma NOS” is used because some cancer registries lack sufficiently specific data for lineage-based classification.

Table 4.16. Haematopoietic and lymphoid tissues (9590–9992)

| | |
|--|--|
| 1 Hodgkin lymphoma | 9650–9667 |
| 1.1 Nodular lymphocytic predominance | 9659 |
| 1.2 Classical lymphocyte-rich | 9651 |
| 1.3 Nodular sclerosis | 9663–9667 |
| 1.4 Mixed cellularity | 9652 |
| 1.5 Lymphocytic depletion | 9653–9655 |
| 1.6 Unspecified | |
| 2 B-cell neoplasms | 9597, 9670–9699, 9712, 9728, 9731–9738, 9761–9764, 9811–9818, 9823–9826, 9833, 9836, 9940 |
| 3 T-cell and NK-cell neoplasms | 9700–9726, 9729, 9827–9831, 9834, 9837, 9948 |
| 4 Myeloid neoplasms | 9840, 9860–9931, 9945–9946, 9950, 9960–9964, 9975, 9980–9989, 9991–9992 |
| 5 Non-Hodgkin lymphoma NOS | 9591 |
| 6 Other specified malignant neoplasms | |
| 7 Unspecified malignant neoplasms | 9590, 9596, 9727, 9760, 9800–9801, 9805–9809, 9820, 9832, 9835, 9965–9967, 9971 |

Chapter 5: Data comparability and quality

Freddie Bray, Aude Bardot, Isabelle Soerjomataram,
and Jacques Ferlay

INTRODUCTION

The utility of a cancer registry is contingent on the underlying quality of its data and the quality control procedures it has in place (Bray and Parkin, 2009; Parkin and Bray, 2009); the primary function of *Cancer Incidence in Five Continents* (CI5) is to enable the comparison of cancer incidence rates across a multitude of populations worldwide. In the evaluation of registered cases, three dimensions of quality have been assessed to ensure that the registry submissions to this volume meet a sufficiently high standard for inclusion.

Comparability is the extent to which a registry's coding and classification procedures and definitions adhere to established international standards and guidelines. The definition of an incident case is especially important in evaluating comparability.

Completeness is the degree to which all diagnosed neoplasms within a registry's catchment population are included in the registry database. Several methods can be used to evaluate the level of completeness of the enumeration of cases within a catchment population.

Validity (or accuracy) is the proportion of cases recorded as having a given characteristic that truly do have that attribute. Several indicators of validity relate to the precision of a registry's source documents and the level of expertise in abstracting, coding, and recoding cases.

The preparation and evaluation of the indices of data quality for CI5 require careful attention from the volume editors, to ensure that all accepted datasets are of sufficiently high quality to merit their inclusion in the volume. The editorial procedures used to conduct a transparent and impartial evaluation of each submitted dataset are outlined in this chapter.

ELEMENTS OF THE EVALUATION

The practical aspects and techniques of evaluating cancer registry data quality were examined in a two-part review (Bray and Parkin, 2009; Parkin and Bray, 2009) and were briefly described – with an emphasis on low- and middle-income settings – in IARC Technical Publication No. 43: *Planning and Developing Population-Based Cancer Registration in Low- and Middle-Income Settings* (Bray et al., 2014). The CI5 Volume XII Editorial Board sought to comprehensively assess data quality on the basis of the indicators of comparability, completeness, and validity reported in these publications; in keeping with the approach taken in Volume XI (Bray et al., 2017), readers can examine

and form their own opinions on the quality of individual datasets by reviewing the accompanying comparative tabulations and graphics in the printed book and online. These tables and figures serve as a guide to evaluating registries' adherence to the standard definitions and recommendations, and the completeness and validity of their data.

As in previous volumes, the editors carried out an extensive process of verifying coding, identifying duplicate registrations, querying unlikely or impossible combinations of codes, and converting the data to a standard format before formal editorial consideration. At the meetings of the CI5 Volume XII Editorial Board, the editors consulted a series of pre-assembled registry-specific tables and other documentation:

- a set of editorial tables (see the examples at the end of this chapter, generated using a hypothetical 2013–2017 dataset for a fictional registration area called *Erewhon*);
- tables of site-specific case numbers, age-specific rates, and summary rates (crude, cumulative, and age-standardized), as presented in this volume;
- the populations at risk by sex and age, including the source or method of estimation used (where applicable), and a comparison with the previous 5-year population data (where available), as presented in this volume; and
- the completed questionnaires, including responses related to the definitions used by each registry.

This review process was routinely applied to the evaluation of most of the 813 datasets submitted, but the increasing number of registries submitting data (including 261 registries in China) also warranted additional comparative overviews of key quality indicators across registries by region and country. As in previous volumes, asterisks are used to denote datasets for which particular consideration is required in interpreting the numerical results for some or all of the reviewed cancer sites (see the *Notes on the datasets* section later in this chapter).

COMPARABILITY

Determining the extent of the comparability of a cancer dataset requires consideration of the registry's procedures, including the standards and definitions used in registration. In the preparation of this volume, the editorial team particularly focused on the following procedural aspects:

- the system used for classifying and coding neoplasms;

- the definition of incidence – what constitutes a cancer case, the definition of date of incidence, and the rules for dealing with multiple primaries (i.e. for distinguishing new cases of primary cancer from extensions, recurrences, or metastases of existing cancers); and
- the registration of cancers detected in asymptomatic individuals.

International standards for the classification and coding of neoplasms

The registries were asked to submit their data coded according to the third edition of the *International Classification of Diseases for Oncology* (ICD-O-3) (Fritz et al., 2000) and to verify (and if necessary, to correct) their data before submission. Coding from other systems can be converted to ICD-O-3 using software such as IARCcrgTools (Ferlay et al., 2005).

ICD-O-3 provides a standardized system for coding the following aspects of disease classification:

- **topography:** the anatomical location (body site) of the tumour;
- **morphology:** the microscopic appearance and cellular origin of the tumour;
- **behaviour:** the classification of the tumour as malignant, benign, in situ, or of uncertain behaviour;
- **grade:** the extent of differentiation of the tumour; and
- **basis of diagnosis:** the method of diagnosis used.

Definition of incidence

The CI5 Volume XII call for data specifically requested the submission of data on all primary tumours, including data (if collected) on basal and squamous cell skin cancers and non-malignant tumours of the central nervous system and urinary bladder. The rules for determining incidence date and multiple primaries are briefly described below.

Incidence date: Because the period from the occurrence of the first mutation to the clinical diagnosis of cancer often spans decades, a standardized definition of cancer is needed for determining whether to register a case and establishing the precise date when the disease became incident. Incidence dates are commonly defined using a hierarchical set of rules from one of three available algorithms, published by

IARC (Jensen et al., 1991), the European Network of Cancer Registries (ENCR) (Pheby et al., 1997), and the Surveillance, Epidemiology, and End Results (SEER) Program in the USA (Johnson et al., 2007). The registries were asked to state whether one of these algorithms or other, in-house rules were applied.

Multiple primaries: Because an individual may develop more than one cancer, there must be a clear distinction between new cases of primary cancer and cases that are actually extensions or progressions, recurrences, or metastases of an existing cancer. There are two sets of rules commonly used by cancer registries for this purpose. The SEER rules (Johnson et al., 2007) are used mainly by cancer registries in North America, whereas the jointly developed IARC/IACR rules (IARC, 2004) tend to be used throughout the rest of the world, at least for the purpose of reporting incidence rates.

The SEER rules result in somewhat higher incidence rates because they allow for the occurrence of multiple incident cancers at the same body site, providing the new case occurs 2 months to 5 years (depending on the site) after an earlier diagnosis, whereas the IARC/IACR rules allow for the occurrence of only one cancer per body site during a patient’s lifetime, unless there are multiple cancers of different histological types. The SEER rules also recognize new cases at different subsites of the same organ or on opposite sides of the body (for paired organs) (Weir et al., 2016). Melanoma and cancers of the breast, kidney, and colon are among the common cancer types for which the numbers of incident cases vary depending on which rules were used (Table 5.1).

Links to these rules were provided to all contributors to this volume. The registries were asked to include all multiple primary cancers in their submitted datasets for the time period covered (2013–2017) and to state which set of rules was used to define new primary cancers, and whether these could be distinguished from subsequent primaries that occur in the same person. The sites at which varying definitions of multiple primaries are likely to have the largest effect on incidence rates are listed in Table 5.1, along with the percentage differences in incidence at these sites (among a subset of SEER registries in the USA) using the SEER definition of a second primary (Johnson et al., 2007) versus the IARC/IACR rules (IARC, 2004).

Table 5.1. The percentage difference in crude and age-standardized incidence rates (at selected body sites) within the SEER (9 registries) 2013–2017 dataset when determined using the SEER rules for multiple primary cancers versus the IARC/IACR rules (2004)

| Body site | Difference in incidence rates using the SEER rules vs the IARC/IACR rules (%) | | | |
|-----------------------|---|------------------|---------|------------------|
| | Males | | Females | |
| | Crude | Age-standardized | Crude | Age-standardized |
| Colon | 3.4 | 3.3 | 3.8 | 2.6 |
| Lung | 2.6 | 2.6 | 3.7 | 3.8 |
| Skin (melanoma only) | 11.2 | 9.6 | 6.5 | 5.9 |
| Breast | – | – | 6.9 | 6.4 |
| Testis | 1.6 | 1.7 | – | – |
| Kidney | 4.5 | 4.8 | 2.6 | 2.8 |
| All sites except skin | 2.8 | 2.6 | 4.0 | 3.6 |

Registration of cancers in asymptomatic individuals

Incidental diagnosis is the detection of cancer in an asymptomatic individual (e.g. upon microscopic examination of tissue that has been removed for a reason unrelated to cancer). The incidental diagnosis of cancer occurs with particular frequency as a result of screening examinations and at autopsy.

Screen-detected cancers

When a screening programme is introduced within a population, cancer incidence rates increase, because the programme identifies prevalent cancers that are detectable by the screening test but have not yet progressed to the stage where they begin to cause symptoms. After the initial rounds of screening, these prevalent cases have all been detected, so the incidence rate decreases, but usually not all the way to the pre-screening level, due to some degree of overdiagnosis. This phenomenon occurs when cases are detected that would otherwise not have been diagnosed during a person's lifetime, either because the cancer was so slow-growing that the individual would have died of another cause before the cancer was detected, or because the cancer was non-progressive and would never actually have become invasive. These cancers are sometimes called pseudodisease. Overdiagnosis can occur as a consequence of breast cancer screening, and it is even more common in prostate cancer testing. In both cases, screening (by mammography for breast cancer or by prostate-specific antigen [PSA] testing for prostate cancer) identifies small, slow-growing, latent tumours. Although many of these tumours would never have progressed to clinically significant cancer during the patient's lifetime, it is currently impossible to predict which of them will. Therefore, incidence rates are elevated in screened populations. Mammography screening programmes typically target women within the age range of 50–74 years. Men may undergo PSA testing at any age, but it is more common among men older than 50 years. In addition, the increased use of diagnostic testing such as use of ultrasound, computed tomography (CT), and magnetic resonance imaging (MRI) may have resulted in increased incidental findings of certain tumours, notably of the thyroid.

Almost all cancer registries include malignant tumours that are detected during screening programmes or diagnosed on the basis of histological specimens taken from asymptomatic individuals in whom there was no clinical suspicion of cancer. The inclusion of these cases is likely to increase incidence rates, because at least some of the malignant cells identified in these ways would never have resulted in a clinical cancer diagnosis had they otherwise remained undetected.

Autopsy-detected cancers

Most cancer registries include cases identified during necropsy examinations of individuals in whom cancer had not been diagnosed (or perhaps even suspected) during life. The extent of the resulting inflation of incidence rates depends on the prevalence of necropsy examinations within the population. The impact is greatest in countries and regions with legislation

that permits autopsies to be conducted for medical, scientific, or educational purposes without consent. However, such practices have generally been declining in most countries over recent decades.

Application of international standards in low- and middle-income settings

Cancer registries operating in low- and middle-income settings may face particular challenges to following international registration standards (Bray et al., 2014). For example, a lack of coverage by pathology laboratories or difficulty accessing diagnosis records reduces the percentage of microscopically verified cases and results in postponement of the incidence date as determined according to the ENCR recommendations, which define the incidence date as the date of first histological or cytological confirmation of malignancy.

COMPLETENESS

Completeness – the extent to which all of the incident cancers occurring in the population are included in the registry database – is a very important aspect of data quality. The incidence rates calculated from registry data most closely approximate their true values within the population when maximum completeness is achieved (through the use of comprehensive case-finding procedures). The methods used in the editorial process for this volume to evaluate overall completeness are semiquantitative, in that they provide an indication of the degree of completeness of a given registry's database relative to those of other registries or over time.

The indices of completeness evaluated during the editorial process can be grouped into four categories:

- historical data:
 - the stability of incidence rates (the number of new cases) over time,
 - a comparison of incidence rates in different populations,
 - age-specific incidence curves, and
 - childhood cancer incidence rates;
- the proportion of cases microscopically verified (MV%);
- the mortality-to-incidence (M:I) ratio; and
- the proportion of death-certificate-only (DCO) cases.

Duplicate registrations of the same case should be avoided through careful attention to record linkage during the registration process. Because the datasets submitted for this volume contained individual anonymous patient identification numbers, it was possible for the editors to check for duplicates (and multiple primaries) according to the IARC/IACR rules (IARC, 2004). However, it was not possible to check for duplicates within a dataset using other data items, which could only be assessed by the individual registries before submission.

Regional comparisons

For several of the quantitative indices described below, a comparison with standard values was performed. In most cases, the standard used for comparison was the values from cancer registries in the same region (or

in the same country when the number of high-quality registries was sufficient), using the data published in the previous two volumes of CI5. Diagnostic practices (especially with respect to histology and cytology) and the accuracy of recording the underlying cause of death on death certificates vary between populations

and regions, but it is reasonable to assume that the incidence rates for specific cancers will tend to be relatively similar in datasets from the same region. In total, 35 regions or countries were defined for the purpose of calculating the standard values used to support editorial decisions (see Table 5.2).

Table 5.2. The regions defined for calculating standard values of age-standardized incidence rates, proportions of cases microscopically verified (MV%), and mortality-to-incidence (M:I) ratios

| Continent | Region or country | Number of registries or populations in the region or country |
|--|--|--|
| Africa | Algeria | 7 |
| | North Africa | 11 |
| | North Africa and West Asia | 17 |
| | Sub-Saharan Africa | 16 |
| Central and South America and the Caribbean | Argentina | 8 |
| | Brazil | 6 |
| | Chile | 5 |
| | Colombia | 4 |
| | Ecuador | 5 |
| | Central America and the Caribbean | 8 |
| | South America | 38 |
| North America | Canada | 12 |
| | USA | 13 |
| Asia | China | 36 |
| | India | 24 |
| | Japan | 9 |
| | Republic of Korea | 8 |
| | Thailand | 16 |
| | Turkey | 9 |
| | Central, Eastern, and Southern Asia | 9 |
| Europe | France | 15 |
| | Germany | 9 |
| | Italy | 36 |
| | Poland | 6 |
| | Russian Federation | 5 |
| | Spain | 14 |
| | Switzerland | 11 |
| | United Kingdom and Republic of Ireland | 13 |
| | Selected Eastern European and Baltic countries | 10 |
| | Eastern Europe | 18 |
| | Northern Europe | 19 |
| | Southern Europe | 8 |
| | Western Europe | 39 |
| Oceania | Australia and New Zealand | 9 |
| | Oceania | 5 |

For each regional group of registries, the data from the previous two volumes of CI5 were used to calculate the mean and variance of the site-specific age-standardized incidence rates, the MV%, and the M:I ratios. Ad hoc tables were used to identify unusually high or low incidence rates in specific regions – both for all sites combined and for certain major cancers. This helped the editors to assess completeness, by enabling them to identify outliers or unusual patterns.

Historical data

Stability of the incidence rates (the number of new cases) over time

Changes in the completeness of registration may lead to the appearance of unexpected or implausible incidence trends. Therefore, one of the key CI5 editorial tables (Editorial table 1) lists the number of new cases registered by major diagnosis groups per calendar year (and the corresponding percentage of the total number of cases), by sex and major cancer sites, with an accompanying bar chart that provides a visual check of the amount of variation in the total numbers of cases per year (at all sites and in both sexes) over the time period covered. At the bottom of each bar, a percentage value indicates how many cases were registered that year relative to the highest number of cases registered in any single year of the covered period. In some cases, this visual check may suggest potential problems or changes within the registration process (or the source population data) during the registration period.

Another editorial table (Editorial table 2) presents, for males and females, average annual incidence rates (per 100 000 person-years) by site and age group, as well as summary rates. This table also includes a column (with the heading *CHV11*) that lists the estimated annual percentage change in the incidence rates since CI5 Volume XI, and the changes that are statistically significant are shown in bold. This incidence rate comparison of CI5 Volumes XI and XII, and other comparisons that were performed as part of the editorial process, are described in the *Statistical tests* section later in this chapter. Changes in incidence rates over time that are larger than expected (and that cannot be attributed to discrepancies in the estimation of person-years at risk) suggest the possibility of changes in the completeness of case ascertainment.

Comparison of incidence rates in different populations

The possibility of incomplete registration is also investigated by comparing observed incidence rates with expected values calculated using data from registries in the same region, and an editorial table is

generated for this purpose (Editorial table 3). This table presents the age-standardized incidence rates, and their standard errors (se), for 23 sites (and the total for all sites) in males and females, along with the ratio of the observed to the expected value (O/E). If the observed age-standardized rate is significantly different from the expected value for the corresponding country or region, the O/E is shown in bold and flagged with a greater-than symbol (>) if the value is higher than expected or a less-than symbol (<) if the value is lower than expected. This comparison and others that were performed as part of the editorial process are described in the *Statistical tests* section later in this chapter. In addition to consulting this editorial table, the editors also frequently compared sorted ranges of values of key indicators from registries covering geographically or ethnically similar populations. In some cases, deviation from regional standards may be the result of specific local variations in the prevalence and distribution of risk factors, or in the presence or intensity of screening for certain cancers, but systematic discrepancies (i.e. those seen for several different sites) suggest the possibility of underregistration (or overregistration, e.g. due to the inclusion of duplicate records).

Age-specific incidence curves

As part of the editorial process, age-specific incidence (per 100 000 person-years) curves for 12 sites by sex (Editorial figure 1) were generated and examined to detect any abnormal fluctuations in the anticipated patterns, such as an unexpected drop in the rate of increase in incidence in older age groups, which may be indicative of underascertainment within these groups (although there can also be other explanations). These curves can also reveal problems with the source files used to determine the size of the populations at risk in the various age groups (see also the *Population* section later in this chapter).

Childhood cancer incidence rates

The incidence rates of cancer (all types combined) in children (i.e. within the age groups 0–4 years, 5–9 years, and 10–14 years) tend to exhibit much less variability than do the incidence rates of cancer in adults, although there are some well documented geographical and ethnic differences for certain childhood cancers. The possibility of underenumeration (and duplicate registration) in this age range within the Volume XII data was investigated by comparing incidence rates within the childhood age groups with the corresponding values from Volume XI. The lowest and highest deciles of incidence rates of childhood cancer in the Volume XI data are shown in Table 5.3.

Table 5.3. The lowest and highest deciles of incidence rates (per 100 000) of childhood cancer in Volume XI

| Age group (years) | Boys | | Girls | |
|-------------------|--------|---------|--------|---------|
| | Lowest | Highest | Lowest | Highest |
| 0–4 | < 13.2 | > 26.7 | < 12.2 | > 24.8 |
| 5–9 | < 9.2 | > 15.8 | < 7.1 | > 13.9 |
| 10–14 | < 8.9 | > 17.2 | < 8.1 | > 15.6 |

Proportion of cases microscopically verified (MV%)

The MV% is the percentage of cases that were diagnosed on the basis of microscopic verification of a tissue specimen (sometimes also called morphological verification; the two terms are synonymous). The definition of microscopically verified cases includes histologically confirmed cases, cases diagnosed on the basis of exfoliative cytology specimens, and cases of leukaemia diagnosed on the basis of haematological examination (without examination of bone marrow). The main use of MV% as an indicator of data quality is as a measure of validity (see the *Validity* section later in this chapter), but a very high proportion of cases diagnosed by histology, cytology, or haematology – higher than might reasonably be expected – may also suggest that a registry is overreliant on pathology laboratories as a source of information and is failing to find cases diagnosed by other means. Editorial table 3 also includes a column showing observed MV% values for 23 sites (and the total of all sites) in males and females. In this MV% column, any observed values that are significantly greater than or less than the expected value (an average for the corresponding country or region) are shown in bold and flagged with a greater-than symbol (>) or a less-than symbol (<), respectively. This comparison is also described in the *Statistical tests* section later in this chapter.

Mortality-to-incidence (M:I) ratio

The M:I ratio is an important indicator of completeness, and its use for this purpose is an example of the independent case ascertainment method of evaluating registry completeness. The M:I ratio compares the number of deaths due to a specific type of cancer over a specific period of time (obtained from a source that is independent of the registry – usually the vital statistics system) with the number of new cases of that type of cancer registered during the same period. When the quality of the mortality data is good (especially in terms of the accuracy of cause of death) and incidence and survival are in steady state, the M:I ratio is approximated by 1 minus the 5-year survival probability. Because both survival and the quality of mortality statistics are somewhat related to the level of socioeconomic development, it is important to consider a registry's geographical location when evaluating this statistic. As part of the CI5 editorial process, the observed M:I ratios for registries' datasets were compared against standard values from the same region, testing for significant differences (see the *Statistical tests* section later in this chapter). Editorial table 3 includes a column showing observed M:I ratios for 23 sites (and the total of all sites) in males and females. Within this column, any observed values that are significantly greater than or less than expected (based on the average regional values from Volume XI) are shown in bold and flagged with a greater-than symbol (>) or a less-than symbol (<), respectively.

M:I ratios that are higher than expected raise suspicion of incompleteness (i.e. incident cancers missed by the registry), especially if the values are high for several different sites. However, underreporting or overreporting of tumours on the death certificates distorts this relationship, as does a lack of constancy

in incidence and case fatality (the rate of death among incident cases) over time. For example, if incidence increases while case fatality (or survival) remains relatively constant, the M:I ratio tends to be less than (1 minus survival); conversely, if incidence decreases relative to case fatality, the M:I ratio is greater than (1 minus survival) and may even exceed a value of 1 for more lethal cancers.

All contributing registries were asked to provide cancer mortality data from an independent source and to state the source. The use of this method requires mortality data that are of good quality, especially in terms of the accuracy of cause of death. This method cannot be used where there is no comprehensive death registration, or when cause of death is missing or inaccurate on death certificates, which is the situation in almost all countries in Africa and many countries in Asia.

Death certificate methods of evaluating completeness

Access to death certificates is important to cancer registries as a means of finding cases not captured by other registration procedures. The completeness of registration may be evaluated on the basis of the proportion of incident cancers that come to the registry's attention via death certificates. Fig. 5.1 illustrates the process of registering new cases using death certificates that mention cancer.

A cancer registry's record linkage procedures should enable the registry to accurately determine whether a death certificate case is already in the database (i.e. previously notified by and registered from another source). A death-certificate-notified (DCN) case is any case first notified by a death certificate. For some DCN cases, the registry later receives a separate notification (without needing to initiate trace-back procedures), and the case is consequently registered from this non-death-certificate source. Because it is possible (depending on registry procedures) for a death certificate mentioning cancer to be received before other relevant notifications (e.g. a pathology report), it has been suggested that registries should establish a suitable interval between receiving a first notification by death certificate and initiating a registration on the basis of this information. If no other notifications are received after this interval, trace-back procedures are initiated. Some cases that are successfully traced back may be found not to be cancers, and are therefore not registered. The remaining cases are classified as death-certificate-initiated (DCI) cases, of which there are two types: (1) successfully traced cases found to be cancers, which are consequently registered from the appropriate source, and (2) cases for which no information source other than a death certificate mentioning cancer can be found, which are consequently registered as death-certificate-only (DCO) cases.

DCO cases represent the residuum of the trace-back process; they are the remaining DCN cases for which no other information source could be obtained through any of the registry's trace-back procedures. Therefore, by itself the proportion of DCO cases (DCO%) is not an indicator of completeness of registration; a low DCO% may indicate efficient case finding or may result from the efficient trace-back of

DCN cases. However, the proportion of DCI cases (DCI%) is always greater than or equal to the DCO%, so an elevated DCO% is suggestive of incompleteness.

Like other indicators, the DCO% must be interpreted in the context of local circumstances. In some transitioning countries, the quality of death certificates may be very poor, with many deaths erroneously attributed to cancer, and registries may have difficulty tracing these notifications back to a hospital or a

clinician capable of confirming (or contradicting) the death certificate statement.

Because death certificate methods rely on the availability of relatively high-quality (complete and accurate) certification of cause of death within the registration area, they are not readily applicable in many low- and middle-income settings, or even in many high-income settings.

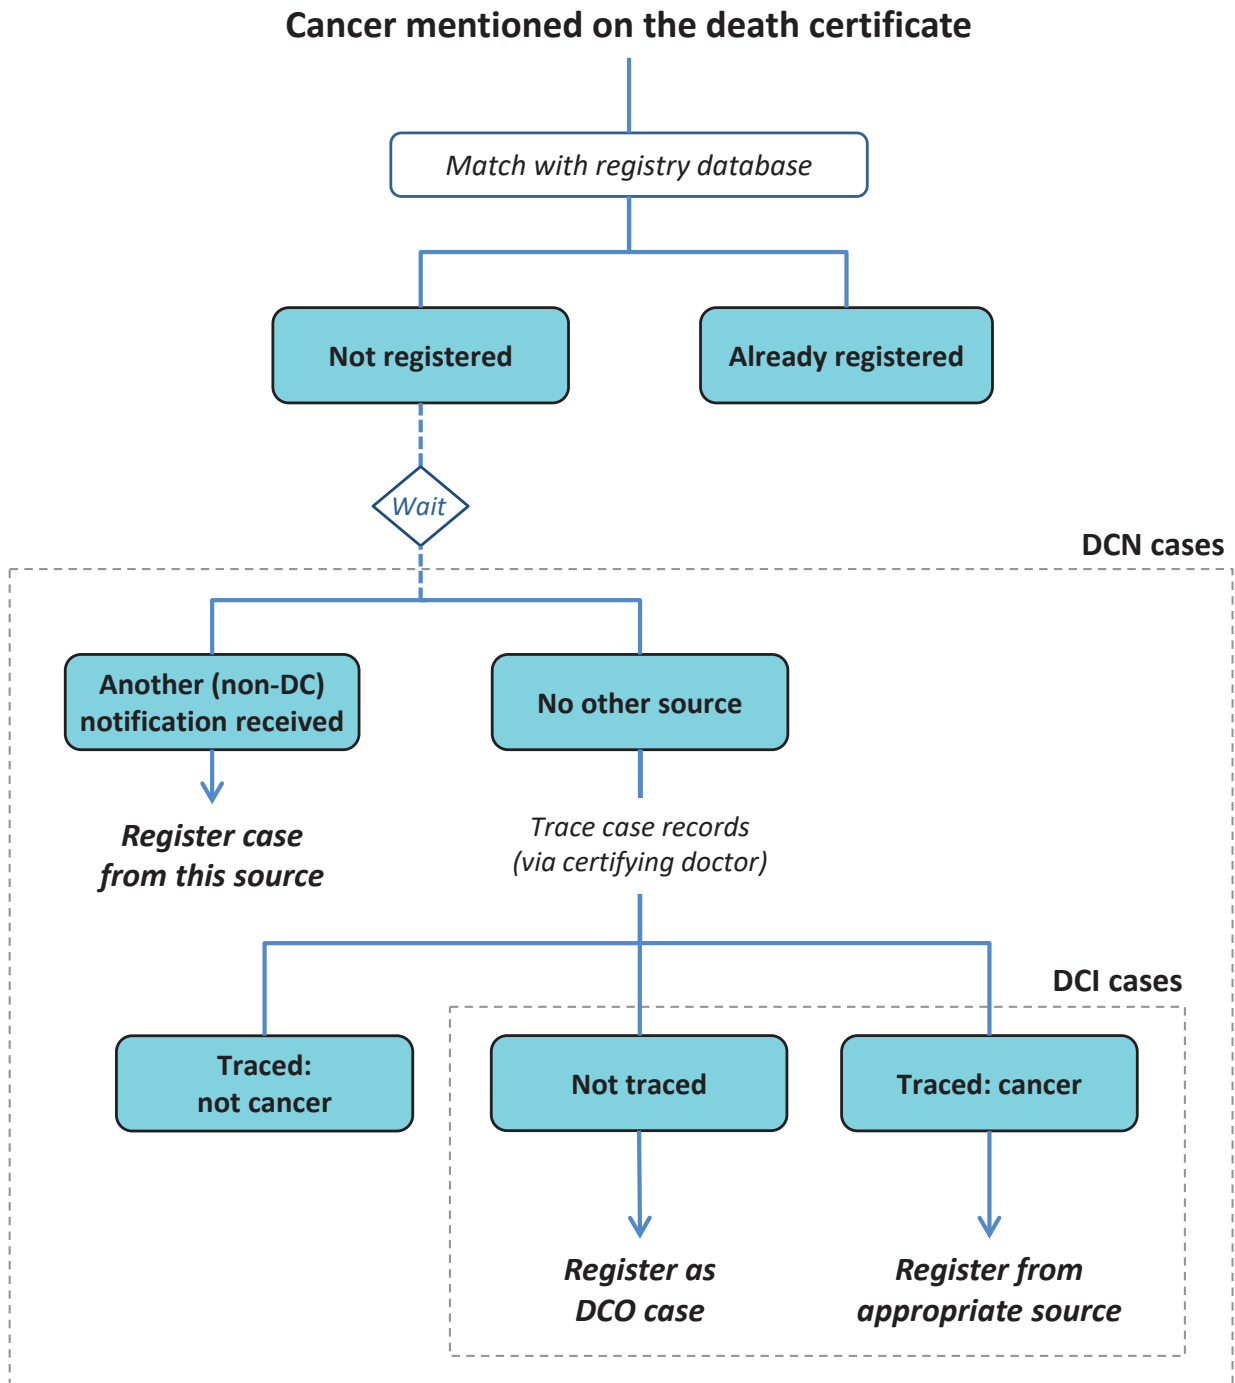

Fig. 5.1. The process of using death certificates (DCs) to identify new cancer cases, which may subsequently be classified as death-certificate-notified (DCN), death-certificate-initiated (DCI), or death-certificate-only (DCO) cases (see the chapter text for more details). Adapted from European Journal of Cancer, 45(5), Bray F and Parkin DM, Evaluation of data quality in the cancer registry: principles and methods. Part I: comparability, validity and timeliness, pages 747–55, Copyright 2009, with permission from Elsevier.

VALIDITY

Validity (or accuracy) is defined as the proportion of cases in a dataset recorded as having a given characteristic (e.g. site or age) that truly do have that attribute. Several methods are used in this volume to provide numerical indices of validity, which enable (at least on an interval scale) comparisons between registries, within a single registry over time, and within a single registry with respect to specified subsets of cases (cases at certain sites, from different sources, etc.). These methods include internal consistency methods, diagnostic criteria methods (histological verification and DCO cases), and missing information analyses (e.g. primary site unspecified, age unknown).

Internal consistency

The use of the IARCcrgTools software to perform consistency checks on the submitted datasets is described in Chapter 6 of this volume. Registries were asked to verify and correct their data using this or other software tools before submission, and to ensure that the ICD-O-3 coding system was used for all relevant variables.

Microscopic verification

Typically, the accuracy of a stated diagnosis is likely to be better if the diagnosis is based on histological examination by a pathologist. However, surveys have shown that many cancer registries code diagnoses based on exfoliative cytology (often used for lung cancer, cervical cancer, etc.) or haematological examination of peripheral blood in the same category as those based on histological examination (i.e. the cases are all coded as microscopically verified), making it impossible to distinguish between them in the data. Partly for this reason, the index of validity used in the editorial tables and the tables showing indices of data quality located at the end of this volume include the MV% rather than the proportion of cases histologically verified (HV%).

As noted in the *Completeness* section above, any observed MV% values in Editorial table 3 that are significantly greater than or less than expected (compared with the regional standard) are shown in bold and flagged with a greater-than symbol (>) or a less-than symbol (<), respectively.

Death-certificate-only (DCO) cases

The proportion of cancers for which no information other than a death certificate mentioning cancer can be found – the DCO% – is another measure of validity, because the information on death certificates is generally less accurate and/or precise than information obtained from clinical or pathology records. A considerable effort has been made in the editorial process to ensure that cases reported as DCO truly are DCO cases. As stated earlier in this chapter, DCO cases represent the residuum of the trace-back process; they are the remaining DCN cases for which no information other than a death certificate mentioning cancer could be obtained through any of the registry's trace-back procedures (see Fig. 5.1). Establishing acceptable and objective criteria for the DCO% has been a contentious issue in international comparative studies. As stated earlier, a low DCO% may simply reflect efficient trace-

back of cases initially missed by the normal case-finding procedures. The DCO% is also influenced by local circumstances (including the availability and accuracy of death certificates) and the registry's ability to successfully link records.

Other and unspecified/age unknown

The proportion of registered cases with unknown values for various data items can be an indicator of data quality. Unknown values can result from problems with:

- the data collection system (or access to necessary source documents);
- the item and code values that are defined;
- the application of coding rules.

The definitions used influence the proportion of unknown codes, for example, when evaluating cases with the primary site coded as "Other and unspecified" (O&U). This classification is defined in detail in Chapter 3. Other variables for which the proportion of cases with missing values is commonly evaluated include age, ethnicity, and disease stage. A high proportion of cases with missing values generally implies poor diagnostic precision (as evidenced by the low MV% observed among O&U cases) or a failure to specify the site of the primary cancer in cases diagnosed on the basis of tissue obtained from a metastasis. The proportion of unknown values usually varies by primary site and tends to be higher among elderly patients. The proportions also vary somewhat between registries. The percentages of O&U cases and cases with unknown age, by registry, are shown in Table 5.4 at the end of this chapter.

POPULATION

It is important to remember that a 10% error in the estimation of the population at risk produces the same level of inaccuracy in the calculated incidence rate as a 10% error in enumeration of cases. However, cancer registries are generally not responsible for population estimates and must rely on official censuses or intercensal/postcensal estimates provided by vital statistics departments or their equivalents. The editors asked all contributing registries to provide official population estimates and state the source of the population data. This information has been summarized for each registry entry, along with the average annual population at risk during the period covered by the registrations.

Although the population data provided by the registries could rarely be directly verified by the editors, the shapes of the population pyramids, as well as any irregularities in the age-specific incidence curves, were used to identify potential errors in the population estimates, and if necessary the appropriateness of the source of the information provided was queried. In addition, a comparison with previous population estimates (if available) was undertaken. Potential problems with estimating the population at risk are stated in the *Notes on the data* section of each registry entry. In some cases, a high likelihood of inaccuracy in estimates of the population at risk contributed to the editorial decision to mark a registry's contribution with an asterisk.

NOTES ON THE DATASETS: THE ASTERISKS (*)

The presence of an asterisk indicates that additional care is required in interpreting the numerical results for some or all cancer sites; readers should refer to the *Notes on the data* section of the corresponding registry entry for the specific reasons. The principal use of the asterisks is to denote datasets that are considered by the editors to have characteristics suggesting questionable quality or completeness of information on cases or the population at risk, as well as datasets for which the editors could not evaluate the relevant indices because of deficiencies in the registration process. The criteria used in this judgement were not rigidly defined; the decision was based on an examination of all the indices described in this chapter and knowledge of the local circumstances within which the registry operates. The intrinsic value of a given dataset in providing information on little-known geographical and ethnic patterns, as well as continuity with earlier data from the same registry, were also taken into consideration. For the purpose of comparability between registries, all datasets for which no official mortality data could be provided or that included no DCO registrations (because of lack of access to death certificates) were also flagged with an asterisk. In addition, an asterisk was noted for registries for which a completed questionnaire was not received.

STATISTICAL TESTS

Four comparisons (for which statistical tests were applied) were made as part of the editorial process for C15 Volume XII:

- a comparison of each age-standardized incidence rate with the corresponding value from Volume XI;
- a comparison of each registry's age-standardized incidence rates for major sites with the corresponding Volume XI values for registries in the same country or region;
- a comparison of each registry's MV% values for major sites with the corresponding Volume XI values for registries in the same country or region; and
- a comparison of each registry's M:I ratios for major sites with the corresponding Volume XI values for registries in the same country or region.

The results of these tests were not published but have been used to flag certain registry datasets as unusual or possibly inconsistent with previously published data, and therefore requiring further investigation. This battery of tests was first implemented in Volume VIII, and the methodological details and formulae are provided in Chapter 5 of that volume (Parkin and Plummer, 2002).

Data compared with that from 12 cancer registries in the the same region/country
Significant lower (<) or higher (>) changes are marked in bold.

Mortality data: official statistics

A detailed description of the statistical tests used can be found in the *Comparability and quality of data* chapter (page 72) of Volume VIII.

Chapter 6: Data processing

Murielle Colombet, Aude Bardot, and Jacques Ferlay

The call for data for Volume XII of *Cancer Incidence in Five Continents* (CI5) was launched in July 2021. The call included detailed instructions about the content and format of the material to be submitted and was disseminated to all identified cancer registries worldwide and posted on the IACR website. Registries that wished to submit data for inclusion in CI5 Volume XII were asked to provide cancer incidence and mortality data, population data, a 350-word introductory text (narrative), a completed questionnaire, a coding schema, and other relevant information.

DATA FLOW

Registries were asked to submit all material via the IARC Registries Portal, at a secure website (<https://cinportal.iarc.fr/>). The portal enables the automatic exchange of information between the cancer registries and the CI5 Secretariat at the Cancer Surveillance Branch (CSU) at IARC. Based on each registry's access credentials and the submitted data file types, uploaded files were automatically named and stored in an organized system of folders on an internal server at IARC. The submitting registry and the designated CSU staff members were notified of each submission by an automatically generated email. Throughout the process, the registries could review their submissions and manage their uploaded files at any time.

The portal was also used for communication between IARC and potential contributors during the editorial process. Requests for data correction, table revision, or supplementary information, as well as decisions about registries' inclusion in the volume, were communicated through the portal. The relevant files were uploaded to the registry-specific *Feedback* section of the portal, where the registries could retrieve the files after being notified by an automatically generated email. The registries could then submit their responses and any revised or supplementary data in the same way as their initial material. A log of the files' movements on the IARC server was monitored by CSU staff members.

A schematic representation of the overall flow of data and processing steps is shown in Fig. 6.1.

DATA PROTECTION

All raw, individual-level data collected for CI5 Volume XII were stored on a secure protected server at IARC, to which only a limited number of selected CSU staff members had access. These data will not be used for any other purpose or transferred to any third party without the registries' explicit permission.

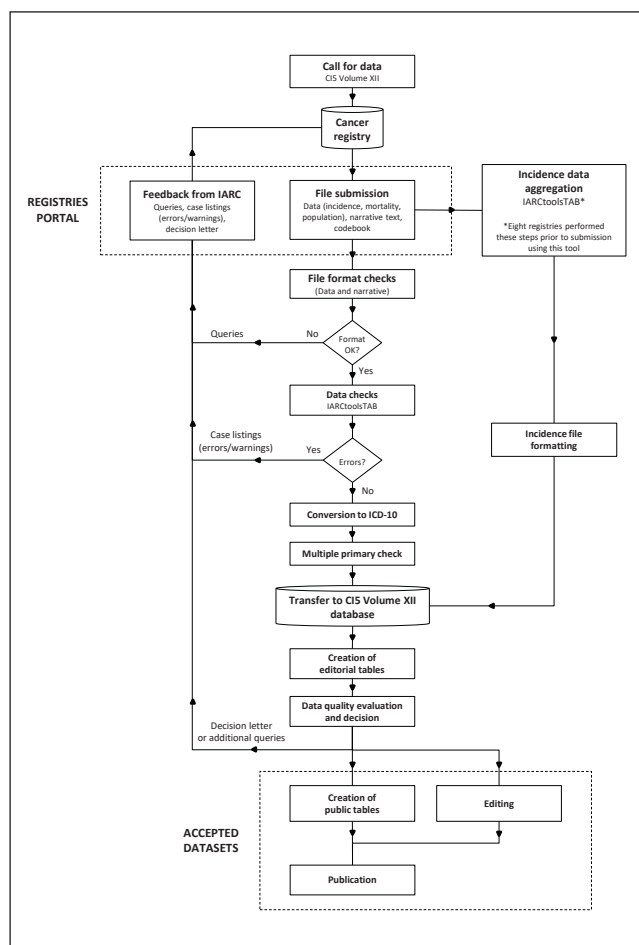

Fig. 6.1. A schematic representation of the overall flow of data and processing steps in the creation of Volume XII of *Cancer Incidence in Five Continents*.

DATA PROCESSING

A total of 675 cancer registries submitted data in response to the invitation to participate in CI5 Volume XII. Although the preferred file formats were specified in the study protocol, data were received in several electronic formats (text files, spreadsheets, database files, etc.), with varying layouts. Therefore, the first step of data processing included a quick check of the files' contents (sometimes resulting in a request for additional material), as well as some reorganization and formatting.

About 149 million individual cancer records were received and processed by IARC. The largest dataset, with about 32 million records, was supplied by the

National Program of Cancer Registries (NPCR) in the USA. Coupled with mortality files, preliminary datasets representing 813 populations (including various ethnic groups) were produced and reviewed by the editors (see Chapter 5). All submitted data were processed and checked by IARC using automated in-house processes based on standard measures of data quality.

The IARC software package IARCtoolsTAB (Colombet et al., 2020) was used to check and convert the data. This tool was also made available to population-based cancer registries that wished to supply their incidence data for CI5 Volume XII in an aggregated format. Eight registries provided aggregated data using this tool (cancer registries of Denmark, Finland, Iceland, Japan, The Netherlands, Norway, Sweden, and UK, England). All programs used to process, check, and convert the data and create the tables were written in Stata, R, and C++.

Incidence data

Registries were asked to submit their incidence data as individual anonymized case listings including all malignant tumours and non-malignant tumours (except benign tumours) of the bladder and of the central nervous system, collected for the longest period possible, and to include incident diagnoses for a minimum of 3 consecutive years within the period of 2013–2017. Each record contained at least the following variables:

1. A registration number that uniquely identified the patient
2. Sex
3. Ethnic group or race (optional)
4. Birth date and/or age at incidence date
5. Incidence date
6. Tumour site (topography)
7. Tumour morphology
8. Tumour behaviour
9. Most valid basis of diagnosis.

Descriptions of the codes used for each variable were also required. However, it was not unusual for code values not to match the descriptions provided, or for coding information to be missing. In such cases, the registry was asked for clarification and to provide the correct codes if necessary. This was particularly important for calculating the percentage of microscopically verified or death-certificate-only (DCO) cases, for evaluating the important indicators of data quality influencing the decision to include a dataset in the volume, and for determining the potential designation of data with an asterisk.

CONVERSION TO ICD-O-3

Although almost all registries submitted data already coded to ICD-O-3 (Fritz et al., 2000) or to the 2011 revision of ICD-O-3 (WHO, 2013), three datasets had to be converted to ICD-O-3 before processing. The alternative coding system used in the three population-based cancer registries was a combination of ICD-10 (WHO, 1992) topography with ICD-O morphology. Conversions from ICD-10 combined with ICD-O required a two-step process: conversion from ICD-10 to ICD-O-2 and then to ICD-O-3. These preliminary conversions helped to detect incompatibilities between ICD-10

codes and the ICD-O system. Any incompatible records were sent back to the registry for review and correction.

CHECKING

All datasets with complete ICD-O-3 coding of tumour site, morphology, behaviour (and optionally grade), and basis of diagnosis were run through the IARC-CHECK program (Ferlay et al., 2005) included in the IARCtoolsTAB package, which performed the following checks:

1. Code verification
 - Sex
 - Age
 - Incidence date (and birth date, if provided and complete)
 - ICD-O-3 topography, morphology, behaviour, and basis of diagnosis.
2. Consistency between items
 - Age versus birth and incidence dates
 - Chronology between birth and incidence dates
 - Sex versus site
 - Sex versus histology
 - Age versus site
 - Age versus histology
 - Site versus histology
 - Basis of diagnosis versus histology
 - Behaviour versus site
 - Behaviour versus histology.

Registries submitting data for CI5 Volume XII were invited to process their data through the IARC-CHECK program before submission, and most did so. The datasets of registries that used CanReg software (available from <http://www.iacr.com.fr/>) were checked using the equivalent built-in functionalities. All datasets were rechecked by CSU staff members. Any errors or unlikely or rare combinations of items were sent back to the registry for verification, unless they were already flagged as double-checked. The received corrections and resubmissions were then consolidated, converted if necessary, and rechecked to ensure that no further errors were found. More than one cycle of data validation was required for many of the datasets.

MULTIPLE PRIMARIES

All records included a unique patient number, so it was possible to check for multiple primary tumours occurring in the same patient using the multiple primary check program included in the IARCtoolsTAB package. The software lists all sets of tumours recorded for a single patient that should be considered a single primary tumour according to the IARC/IACR rules specifically defined for ICD-O-3 (IARC, 2004) and modified to take into consideration the new terms that appeared in the 2011 revision (see Chapter 3). The longer the time period for which data were submitted, the more complete the identification of multiple primary tumours within the reference period (2013–2017).

CONVERSION TO ICD-10

When no errors remained, the incidence data were converted from the first (2011) revision of ICD-O-3 to ICD-10 (2010 version), to ensure that the ICD-10

categories resulted from the same conversion process (ICD-O-3 to ICD-10) for all cancer registries. The ICD-O-3 to ICD-10 conversion program was written at IARC and is based on the rules defined in *Conversion of Neoplasms by Topography and Morphology from ICD-O-2 to ICD-10* by Percy (1998). In summary, each new ICD-O-3 morphology code (as listed in Appendix 1 of ICD-O-3) was converted first to the closest ICD-O-2 morphology code using the ICD-O-3 to ICD-O-2 conversion program (Fritz and Ries, 2001), and then the corresponding ICD-O-2 to ICD-10 conversion rule was applied. For example, the ICD-O-3 code M8174/3 (Hepatocellular carcinoma, clear cell type) was converted to the ICD-10 code C22.0, following the rule that applies to the ICD-O-2 code M8170/3 (Hepatocellular carcinoma, not otherwise specified [NOS]). The 2011 revision of ICD-O-3 affected the morphology numerical list only, introducing new terms that have appeared in the recent literature, particularly in the "Lymphoma and leukaemia" group. Therefore, a new conversion table from the first (2011) revision of ICD-O-3 to ICD-10 (2010 version) for the ICD-O-3 morphology codes 9590/3 to 9992/3 was developed (see Chapter 3).

The conversion rules strictly follow the ICD-10 coding rules expressed in the instruction manual of ICD-10 Volume 2 and the alphabetical index of ICD-10 Volume 3. For example, the combination of unknown primary site (ICD-O-3 topography code C80.9) and fibrosarcoma, NOS (ICD-O-3 morphology code 8810/3) was converted to ICD-10 code C49.9 (Connective and other soft tissues, NOS; see ICD-10 Volume 2, p. 74). The ICD-O-3 codes M9950/3, M9960–9965/3, M9971/3, and M9975/3 (myeloproliferative disorders [MPD]), and M9980–9983/3, M9985–9989/3, M9991/3, and M9992/3 (myelodysplastic syndromes [MDS]), for which no ICD-10 code in the malignant C category exists, were converted to the ICD-10 codes D45, D46_, and D47_ (i.e. non-malignant tumours), respectively, and are included and presented in the tables under the categories MPD and MDS (see Chapter 3).

MISCELLANEOUS CONVERSIONS

In addition to tumour topography and morphology, certain other variables (sex, basis of diagnosis, ethnic group or race, and dates) were also recoded to a common system according to the descriptions supplied by the registries.

Mortality data

Together with data on cancer incidence, registries were asked to provide official cancer mortality data for the reference period (2013–2017), ideally for each calendar year of the period. For the national cancer registries, mortality data were extracted from the WHO Mortality Database (<https://platform.who.int/mortality/>) by CSU staff members. The mortality data were used for editorial purposes as an indicator of the completeness of registration. Because the data were generally provided in tabular form for the available ICD-10 (and sometimes ICD-9) three-digit categories by sex and 5-year age

groups, only checks for the validity of the ICD code and the combination of sex and site were performed. The data provided by some registries were grouped into wider cancer sites or age groups than conventionally used, and therefore had to be reformatted before being processed by the series of editorial programs and added to the CI5 Volume XII database. Some population-based cancer registries supplied mortality data based on the cancer registry dataset. Such data were not considered by the volume editors to represent official mortality data (see Chapter 5).

Population data

The registries were required to submit population denominators for each individual year of the reference period, by sex and 5-year age groups. In the absence of corresponding data sources, a population denominator for a single central year of the reference period was accepted. The population data were checked first by careful examination of the data file, then by comparing the age distribution with that from the previous CI5 volume, if available. Unexpected changes in the age structure or in the total population by year and sex were identified and queried. After examination, the population files were formatted and added to the CI5 Volume XII database.

THE CI5 VOLUME XII DATABASE

The CI5 Volume XII database contains all the incidence, mortality, and population datasets supplied by the registries and checked by IARC for the project, irrespective of whether they were ultimately selected for inclusion in the volume itself. The data (i.e. the total number of cases, the microscopically verified cases, and the DCO cases) are stored in aggregated format by 18 age groups, sex, calendar year, and 347 disease entities. The database is hosted and maintained on a protected server at IARC, with access restricted to identified CSU staff members.

CONCLUSIONS

The complete process of data checking and validation conducted by IARC in collaboration with the cancer registries took several months. The help provided by those contributors who converted and checked their data before submission was greatly appreciated. Although prompt data provision is of the utmost importance, this importance is counterbalanced by the necessity of validating and ensuring the comparability of the global cancer incidence data. Online publication of the data ahead of the published volume provided earlier public access to the results.

The data processing methods described in this chapter resulted in the standardization of the information provided, which enabled the CI5 editors to compare datasets within large defined geographical regions, as described in Chapter 5. The CI5 data validation processes contributed substantially to the overall quality and comparability of the data from all submitting registries, as well as to data harmonization, with the benefit extending beyond this publication.

Chapter 7: Age standardization

Freddie Bray, Jacques Ferlay, Aude Bardot, and Les Mery

INTRODUCTION

For every type of cancer in every population worldwide, age is a key determinant of the risk of developing the disease (Armitage and Doll, 1954). Furthermore, the age structures of the registry catchment populations included in this volume vary considerably. For these two reasons, meaningful international comparisons of incidence rates must be made independent of the effects of age. This chapter briefly discusses the summary measures used for this purpose in the preparation of *Cancer Incidence in Five Continents (CI5)*, allowing for comparisons of incidence across populations (within Volume XII) and within the same population over time (across consecutive volumes).

As in previous volumes, we emphasize an age-specific assessment of cancer incidence rates as an essential exploratory step in any comparative analysis. Graphical displays of age-specific rates may reveal possible artefacts in the data or provide insights into the biology and etiology of cancer in the population or populations under study. The online resources available at <https://ci5.iarc.who.int/> (and the graphical facilities within) enable a visual inspection that complements the tabulated summaries in the published volume.

To compare incidence across multiple populations or time points, we require a summary measure that absorbs the schedule of age-specific rates in different registries and across time. The crude rate does not take into account the varying age structures in the underlying populations. Therefore, as in previous volumes, two standardized measures – the age-standardized rate and the cumulative rate – are presented; this enables comparisons of cancer risk between registries, independent of the effects of age.

A brief description of the properties of these summary measures is given below, together with the principal calculations involved. Readers who wish to explore the topic in more depth may consult the chapters by Smith (1992) and Day (1992) in CI5 Volume VI. The books by Jensen et al. (1991), Dos Santos Silva (1999), and Kirkwood and Sterne (2003) also include chapters that discuss in practical terms the age standardization of cancer data, whereas Estève et al. (1994) give a more theoretical account of the underlying methodology.

CALCULATING AGE-STANDARDIZED RATES

The age-standardized incidence rate is the summary rate that would have been observed, given the schedule of age-specific rates, in a population with the age composition of some reference population,

often called the standard population. Calculation of the standardized rate is an example of direct standardization, whereby the observed age-specific rates are applied (directly) to a theoretical standard population. The calculation is illustrated in Table 7.1, for female breast cancer incidence data in the Cancer Registry of the Bucaramanga Metropolitan Area in Colombia, as compiled in this volume for 2013–2017. The world standard population was first introduced by Segi (1960), drawn from a pooled population of 46 countries and modified for the first volume of this series by Doll et al. (1966). The Segi–Doll world standard is used in this and all previous volumes of CI5 as a means to rapidly examine geographical and temporal variations in cancer risk.

The main criticism levelled at age-standardized rates concerns the need to select an arbitrary standard population; age-standardized rates can be meaningfully compared only if they refer to the same standard. Although it should be evident that the age composition of the world standard is representative of neither the present nor the future age-specific global population, switching to a more up-to-date standard would be worthwhile only if it could provide benefits that outweighed the drawbacks of rendering the Segi–Doll standardized rates obsolete. However, it has been shown that although very different absolute values of age-standardized rates are obtained using different standards, the estimates of age-adjusted relative risk (the main purpose of such routine comparisons) are quite similar (Bray et al., 2002). Therefore, the main effect of changing the standard to a more up-to-date representation of the global population would be the inconsequential result that the value of the age-standardized rate would be closer to that of the crude rate. Accordingly, for both theoretical and practical reasons, the age-standardized rates in this volume are calculated as previously, using the age composition of the Segi–Doll world standard, shown in Table 7.1.

Age groups are indexed by the subscript i , d_i is the number of cases in age group i , y_i is the number of person-years at risk in age group i , and w_i is the number of individuals in (or the weight of) age group i in the world standard population. The crude rate per 100 000 per year is therefore calculated as follows (using the data presented in Table 7.1 as an example):

$$10^5 \left(\sum_i d_i \right) / \left(\sum_i y_i \right) = 10^5 \times 1650 / 2972542 \\ = 55.5$$

Table 7.1. Calculation of age-standardized incidence rates: breast cancer (ICD-10 C50), Colombia, Bucaramanga, females (2013–2017)

| Age group (years) | No. of cases | Person-years at risk | Age-specific incidence (per 10 ⁵ years) | Standard world population | Expected no. of cases in standard world population |
|-------------------|----------------------|----------------------|---|---------------------------|--|
| <i>i</i> | <i>d_i</i> | <i>y_i</i> | 10 ⁵ (<i>d_i</i> / <i>y_i</i>) | <i>w_i</i> | <i>d_i</i> <i>w_i</i> / <i>y_i</i> |
| 0–4 | 0 | 192 737 | 0.0 | 12 000 | 0.0 |
| 5–9 | 0 | 198 927 | 0.0 | 10 000 | 0.0 |
| 10–14 | 0 | 211 749 | 0.0 | 9 000 | 0.0 |
| 15–19 | 0 | 242 747 | 0.0 | 9 000 | 0.0 |
| 20–24 | 1 | 264 008 | 0.4 | 8 000 | 0.0 |
| 25–29 | 16 | 250 390 | 6.4 | 8 000 | 0.5 |
| 30–34 | 39 | 232 055 | 16.8 | 6 000 | 1.0 |
| 35–39 | 90 | 214 003 | 42.1 | 6 000 | 2.5 |
| 40–44 | 108 | 203 789 | 53.0 | 6 000 | 3.2 |
| 45–49 | 240 | 204 834 | 117.2 | 6 000 | 7.0 |
| 50–54 | 229 | 190 847 | 120.0 | 5 000 | 6.0 |
| 55–59 | 225 | 159 137 | 141.4 | 4 000 | 5.7 |
| 60–64 | 210 | 125 700 | 167.1 | 4 000 | 6.7 |
| 65–69 | 155 | 96 470 | 160.7 | 3 000 | 4.8 |
| 70–74 | 125 | 70 550 | 177.2 | 2 000 | 3.5 |
| 75–79 | 92 | 48 747 | 188.7 | 1 000 | 1.9 |
| 80–84 | 74 | 32 459 | 228.0 | 500 | 1.1 |
| 85+ | 46 | 33 393 | 137.8 | 500 | 0.7 |
| Total | 1 650 | 2 972 542 | 55.5 | 100 000 | 44.7 |

And the age-standardized rate is calculated as follows:

$$\sum_i d_i w_i / y_i = 44.7$$

In this example, the age-standardized rate is 19% less than the crude rate in the same 5-year period. This is because the world standard population has proportionally fewer individuals in the older age groups than does the actual registry population, and the risk of disease (according to the age-specific rates) is higher at older ages.

CUMULATIVE RATE AND CUMULATIVE RISK

The cumulative rate is the sum of the age-specific rates over each year of age from birth to a defined upper age limit. Because age-specific incidence rates are usually computed for 5-year age intervals, the cumulative rate is 5 times the sum of the age-specific rates calculated over the 5-year age groups, assuming that the age-specific rates are the same for all ages within a 5-year age group. In the example of breast cancer incidence in females in the Bucaramanga, Colombia, registry population, all the age groups have a width of 5 years, so the cumulative rate for ages 0 to 74 years is calculated as follows:

$$5 \sum_i d_i / y_i = 5 \times 1002.1 \times 10^{-5} = 0.050$$

The cumulative rate is in fact not a rate at all but a dimensionless quantity most conveniently expressed as a percentage. In the example above, the cumulative rate up to the age of 74 years would be given as 5.0%.

The age span over which a rate is accumulated must be specified. In this volume, the age ranges 0–64 years and 0–74 years are used to provide two representations of the lifetime risk of developing the disease. Other age ranges may be more appropriate for more specific purposes, such as investigating childhood cancers.

The cumulative rate's companion – the cumulative risk – is defined as the probability that an individual will develop the disease in question during a certain age span, in the absence of other causes of death. If the cumulative risk in an age range is less than 10%, as is the case with most tumours, it can be approximated very well by the cumulative rate. Table 7.2 shows the correction needed to convert the cumulative rate into the cumulative risk. For values of less than 10%, the difference between the two is small. The precise mathematical relationship between the cumulative rate and the cumulative risk is as follows:

$$\text{cumulative risk} = 1 - \exp(-\text{cumulative rate})$$

Continuing with our example, the cumulative risk is 4.9%, and thus the estimated risk for a female in Bucaramanga of developing breast cancer between the ages of 0 and 74 years is estimated as 5.0%. In other words, approximately 1 in 20 females would develop breast cancer in this city in Colombia within the specified lifetime, assuming no other causes of death.

Table 7.2. Conversion of cumulative rates, 100x, into the corresponding cumulative risks, 100(1-e^{-x})

| | | | | | | | | | | | |
|------------------------------|-----|-------|-------|------|------|------|-------|-------|-------|-------|-------|
| 100x | 0.1 | 0.5 | 1.0 | 5.0 | 7.0 | 10.0 | 15.0 | 20.0 | 30.0 | 40.0 | 50.0 |
| 100(1-e^{-x}) | 0.1 | 0.499 | 0.995 | 4.88 | 6.76 | 9.52 | 13.93 | 18.13 | 25.92 | 32.97 | 39.35 |

The cumulative rate has two principal advantages over the age-standardized rate. First, because it is a form of direct standardization, the problem of choosing an arbitrary reference population is eliminated. Second, as an approximation of the cumulative risk, it has a greater intuitive appeal and is more directly interpretable as a measurement of lifetime risk, assuming no other causes of death.

CALCULATING THE STANDARD ERROR

Both the age-standardized rate and the cumulative rate are weighted sums of the age-specific rates, so the standard error can be derived in both cases from the same formula. If the age-specific rate in age group i is estimated from d_i cases and y_i person-years, then the age-standardized rate (with w_i representing the standardization weights) is

$$\sum_i d_i w_i / y_i$$

with an estimated variance (based on the Poisson distribution) of

$$\sum_i d_i (w_i / y_i)^2$$

and an estimated standard error of

$$\sqrt{\sum_i d_i (w_i / y_i)^2}$$

For the age-standardized rate, the weights are given by the number of individuals in each age group per 100 000 in the standard population. For the cumulative rate, the weights are equal to the widths of the age groups. When all age groups are 5 years wide, the expression for the standard error (SE) of the cumulative rate (expressed as a percentage) reduces to:

$$SE(\text{cumulative rate}) = 500 \sqrt{\sum_i d_i / y_i^2}$$

Continuing the example of breast cancer incidence in females in the Cancer Registry of the Bucaramanga Metropolitan Area, the estimate (with standard error) is 44.7 (1.11) for the rate standardized to the world population.

CASES OF UNKNOWN AGE

The age-standardized rate and the cumulative rate are necessarily corrected for cases of unknown age that occur within the CI5 registry datasets. The correction procedure involves multiplying the summary measure (based on cases of known age) by T/K , where T is the total number of cases of cancer of the same type in individuals of the same sex, and K is the number of cancers occurring in individuals of known age. The standard errors are also multiplied by the same correction factor (T/K).

This correction relies on the assumption that the cases of unknown age are randomly distributed, and therefore have the same age distribution as the cases of known age. In other words, the correction assumes that the probability that the age of a case is unknown does not depend on the age of the case. Although this assumption probably does not hold – it is more likely that age is not recorded among older patients – it is nevertheless important that all registered cases are accounted for, so that the summary statistics are not underestimated.

AVAILABILITY OF DATA FOR UPPER AGE GROUPS

The precision of rates calculated using direct standardization varies according to the number and width of the age groups used. Age-standardized rates, for example, yield slightly different values depending on the extent to which population data are available for the oldest age groups (aged 75 years or more). For most registries, census data are available for the same 18 age groups shown in Table 7.1, enabling the calculation of rates for the upper age ranges of 75–79, 80–84, and 85+. However, some registries can obtain population data for only 16 or 17 age groups, and thus the oldest age groups instead correspond to individuals aged 75+, or 80+, respectively.

NOTES ON THE DATA

*No official mortality data. No DCO registrations. Low levels of specificity of leukaemias.

20 major cancers, ASR (World) per 100 000

| <i>Male</i> | | <i>Female</i> | |
|-----------------------------|------|-----------------------------|-------|
| Prostate | 19.1 | Cervix uteri | 60.8 |
| Oesophagus | 18.4 | Breast | 17.9 |
| Kaposi sarcoma | 9.2 | Oesophagus | 16.1 |
| Trachea, bronchus, and lung | 5.4 | Kaposi sarcoma | 4.8 |
| Other and unspecified | 3.7 | Ovary | 3.5 |
| Liver | 3.3 | Vulva | 3.1 |
| Larynx | 3.2 | Trachea, bronchus, and lung | 2.7 |
| Eye | 2.3 | Corpus uteri | 2.5 |
| Mouth | 2.0 | Other and unspecified | 2.4 |
| Breast | 1.9 | Eye | 1.5 |
| Non-melanoma skin cancer | 1.5 | Rectum | 1.4 |
| Non-Hodgkin lymphoma | 1.5 | Colon | 1.3 |
| Bladder | 1.5 | Non-Hodgkin lymphoma | 1.2 |
| Rectum | 1.5 | Liver | 1.2 |
| Tongue | 1.4 | Non-melanoma skin cancer | 1.2 |
| Colon | 1.4 | Leukaemia unspecified | 1.0 |
| Penis | 1.1 | Vagina | 0.9 |
| Anus | 0.9 | Mouth | 0.8 |
| Leukaemia unspecified | 0.9 | Thyroid | 0.8 |
| Stomach | 0.7 | Uterus unspecified | 0.8 |
| All sites | 85.8 | All sites | 133.7 |

NOTES ON THE DATA

*No official mortality data.

20 major cancers, ASR (World) per 100 000

| <i>Male</i> | | <i>Female</i> | |
|-----------------------------|-------|-----------------------------|-------|
| Prostate | 23.3 | Cervix uteri | 56.4 |
| Liver | 13.8 | Breast | 10.6 |
| Non-Hodgkin lymphoma | 11.5 | Non-Hodgkin lymphoma | 9.8 |
| Kaposi sarcoma | 10.0 | Liver | 6.9 |
| Oesophagus | 7.8 | Kaposi sarcoma | 3.9 |
| Other and unspecified | 5.5 | Ovary | 2.8 |
| Penis | 5.2 | Non-melanoma skin cancer | 1.8 |
| Breast | 3.2 | Pancreas | 1.7 |
| Trachea, bronchus, and lung | 2.8 | Thyroid | 1.7 |
| Non-melanoma skin cancer | 2.4 | Trachea, bronchus, and lung | 1.4 |
| Connective and soft tissue | 2.0 | Uterus unspecified | 1.4 |
| Eye | 2.0 | Hodgkin lymphoma | 1.4 |
| Larynx | 1.7 | Oesophagus | 1.2 |
| Stomach | 1.5 | Other and unspecified | 1.2 |
| Nasopharynx | 1.5 | Eye | 1.2 |
| Other male genital organs | 1.5 | Leukaemia unspecified | 1.2 |
| Tongue | 1.4 | Melanoma of skin | 1.1 |
| Colon | 1.2 | Nasopharynx | 1.0 |
| Pancreas | 1.1 | Stomach | 0.8 |
| Thyroid | 1.0 | Placenta | 0.7 |
| All sites | 110.2 | All sites | 114.8 |

NOTES ON THE DATA

*High DCO%.

†C67 (bladder cancer) includes neoplasms of uncertain or unknown behaviour together with invasive cancers.

20 major cancers, ASR (World) per 100 000

| <i>Male</i> | | <i>Female</i> | |
|-----------------------------|-------|-----------------------------|-------|
| Non-melanoma skin cancer | 82.4 | Non-melanoma skin cancer | 61.9 |

NOTES ON THE DATA

†C67 (bladder cancer) includes neoplasms of uncertain or unknown behaviour together with invasive cancers.

20 major cancers, ASR (World) per 100 000

| <i>Male</i> | | <i>Female</i> | |
|-----------------------------|-------|-----------------------------|-------|
| Prostate | 63.3 | Thyroid | 47.0 |
| Non-melanoma skin cancer | 44.0 | Breast | 41.8 |
| Stomach | 19.5 | Non-melanoma skin cancer | 38.4 |
| Non-Hodgkin lymphoma | 15.0 | Cervix uteri | 17.5 |
| Thyroid | 10.2 | Stomach | 13.6 |
| Colon | 9.8 | Non-Hodgkin lymphoma | 11.7 |
| Trachea, bronchus, and lung | 8.2 | Ovary | 9.0 |
| Bladder | 6.7 | Colon | 8.5 |
| Kidney | 6.6 | Trachea, bronchus, and lung | 6.8 |

NOTES ON THE DATA

*No official mortality data.

†C67 (bladder cancer) includes neoplasms of uncertain or unknown behaviour together with invasive cancers.

20 major cancers, ASR (World) per 100 000

| <i>Male</i> | | <i>Female</i> | |
|-----------------------------|-------|-----------------------------|-------|
| Non-melanoma skin cancer | 148.5 | Non-melanoma skin cancer | 100.2 |

NOTES ON THE DATA

†C67 (bladder cancer) includes neoplasms of uncertain or unknown behaviour together with invasive cancers.

20 major cancers, ASR (World) per 100 000

| <i>Male</i> | | <i>Female</i> | |
|-----------------------------|-------|-----------------------------|-------|
| Prostate | 72.6 | Breast | 92.7 |
| Trachea, bronchus, and lung | 53.0 | Trachea, bronchus, and lung | 48.6 |
| Colon | 27.0 | Colon | 20.8 |
| Bladder | 22.8 | Thyroid | 19.5 |
| Rectum | 16.0 | Corpus uteri | 17.1 |
| Non-Hodgkin lymphoma | 15.2 | Non-Hodgkin lymphoma | 10.4 |

NOTES ON THE DATA

*Rates based on low numbers due to small population.

10 major cancers, ASR (World) per 100 000

Male

| | |
|-----------------------------|-------|
| Trachea, bronchus, and lung | 58.8 |
| Colon | 38.0 |
| Prostate | 33.7 |
| Kidney | 23.7 |
| Rectum | 20.3 |
| Stomach | 19.0 |
| Pancreas | 13.3 |
| Bladder | 12.7 |
| Liver | 11.8 |
| Other and unspecified | 10.8 |
| All sites | 337.2 |

Female

| | |
|-----------------------------|-------|
| Breast | 99.4 |
| Trachea, bronchus, and lung | 46.6 |
| Colon | 38.9 |
| Rectum | 21.4 |
| Thyroid | 16.8 |
| Kidney | 16.1 |
| Corpus uteri | 12.6 |
| Cervix uteri | 9.4 |
| Stomach | 8.7 |
| Non-Hodgkin lymphoma | 8.4 |
| All sites | 363.1 |

10 major cancers, ASR (World) per 100 000

Male

| | |
|-----------------------------|-------|
| Prostate | 79.8 |
| Melanoma of skin | 35.5 |
| Trachea, bronchus, and lung | 32.2 |
| Bladder | 17.7 |
| Colon | 17.3 |
| Non-Hodgkin lymphoma | 14.7 |
| Kidney | 12.7 |
| Rectum | 10.4 |
| Lymphoid leukaemia | 9.5 |
| Pancreas | 8.5 |
| All sites | 333.1 |

Female

| | |
|-----------------------------|-------|
| Breast | 93.1 |
| Melanoma of skin | 27.9 |
| Trachea, bronchus, and lung | 26.9 |
| Corpus uteri | 18.1 |
| Thyroid | 17.6 |
| Colon | 13.7 |
| Non-Hodgkin lymphoma | 10.1 |
| Ovary | 8.8 |
| Pancreas | 6.5 |
| Kidney | 6.3 |
| All sites | 300.0 |

NOTES ON THE DATA

*No official mortality data.

20 major cancers, ASR (World) per 100 000

| <i>Male</i> | | <i>Female</i> | |
|-----------------------------|-------|-----------------------------|-------|
| Prostate | 75.8 | Breast | 88.0 |
| Trachea, bronchus, and lung | 44.4 | Trachea, bronchus, and lung | 33.9 |
| Bladder | 20.2 | Corpus uteri | 22.0 |
| Colon | 19.9 | Melanoma of skin | 18.4 |
| Melanoma of skin | 19.3 | Thyroid | 17.9 |
| Kidney | 16.9 | Colon | 16.8 |
| Non-Hodgkin lymphoma | 14.2 | Non-Hodgkin lymphoma | 9.9 |
| Rectum | 10.6 | Kidney | 8.7 |
| Pancreas | 9.7 | Ovary | 7.7 |
| Lymphoid leukaemia | 9.6 | Pancreas | 7.1 |
| Liver | 7.0 | Rectum | 6.3 |
| Oesophagus | 6.8 | Cervix uteri | 6.1 |
| Testis | 6.7 | Lymphoid leukaemia | 5.5 |
| Brain and nervous system | 6.7 | Brain and nervous system | 5.2 |
| Thyroid | 6.1 | Bladder | 5.0 |
| Myeloid leukaemia | 5.8 | Other and unspecified | 4.6 |
| Other and unspecified | 5.6 | Myeloid leukaemia | 3.8 |
| Multiple myeloma | 5.3 | Multiple myeloma | 3.4 |
| Tongue | 4.5 | Liver | 2.6 |
| Larynx | 4.2 | Hodgkin lymphoma | 2.4 |
| All sites | 339.6 | All sites | 305.4 |

USA, Louisiana: Black (2013–2017)
Average annual person-years by sex and age group

SOURCE OF POPULATION

United States Census Bureau population estimates for 2013–2017 are a modification of the annual time series population estimates produced by the Population Estimates Program of the Census Bureau with support from the National Cancer Institute. The population estimates incorporate bridged single-race estimates derived from the original multiple-race categories in the 2010 census. These bridged estimates are consistent with the four race groups enumerated in the 1990 census and were produced under a collaborative arrangement between the National Center for Health Statistics and the Census Bureau. The methodology implemented by the Census Bureau to develop these county estimates is comparable to that used to produce national and state 1990–2000 intercensal estimates and is described on the Census Bureau website.

USA, Louisiana: White (2013–2017)

USA, Minnesota: Asian and Pacific Islander (2013–2017)
Average annual person-years by sex and age group

SOURCE OF POPULATION

Provided by the United States Census Bureau, based on decennial censuses and several other surveys, from which annual estimates of the population for each state are derived. Population estimates for the denominators of incidence and mortality rates are race-specific, ethnicity-specific, and sex-specific county population estimates aggregated to the state or metropolitan-area level.

NOTES ON THE DATA

*Rates based on low numbers due to small population.

NOTES ON THE DATA

*Rates based on low numbers due to small population.

10 major cancers, ASR (World) per 100 000

Male

| | |
|-----------------------------|-------|
| Prostate | 149.2 |
| Trachea, bronchus, and lung | 46.6 |
| Kidney | 29.5 |
| Colon | 29.0 |
| Liver | 17.9 |
| Pancreas | 15.9 |
| Bladder | 11.6 |
| Non-Hodgkin lymphoma | 11.1 |
| Rectum | 10.3 |
| Multiple myeloma | 9.4 |
| All sites | 408.1 |

Female

| | |
|-----------------------------|-------|
| Breast | 80.4 |
| Trachea, bronchus, and lung | 48.0 |
| Colon | 17.1 |
| Corpus uteri | 17.0 |
| Thyroid | 11.2 |
| Kidney | 10.8 |
| Multiple myeloma | 10.4 |
| Pancreas | 9.5 |
| Rectum | 9.2 |
| Cervix uteri | 7.8 |
| All sites | 302.1 |

10 major cancers, ASR (World) per 100 000

Male

| | |
|-----------------------------|-------|
| Prostate | 78.4 |
| Trachea, bronchus, and lung | 39.5 |
| Melanoma of skin | 20.2 |
| Bladder | 20.1 |
| Colon | 20.1 |
| Kidney | 16.0 |
| Non-Hodgkin lymphoma | 14.3 |
| Rectum | 10.6 |
| Pancreas | 9.3 |
| Lymphoid leukaemia | 7.9 |
| All sites | 331.6 |

Female

| | |
|-----------------------------|-------|
| Breast | 93.9 |
| Trachea, bronchus, and lung | 32.3 |
| Corpus uteri | 20.9 |
| Melanoma of skin | 19.7 |
| Thyroid | 18.7 |
| Colon | 16.8 |
| Non-Hodgkin lymphoma | 10.0 |
| Kidney | 8.4 |
| Ovary | 8.0 |
| Rectum | 6.8 |
| All sites | 308.3 |

NOTES ON THE DATA

*Rates based on low numbers due to small population.

10 major cancers, ASR (World) per 100 000

Male

| | |
|-----------------------------|-------|
| Prostate | 30.9 |
| Kidney | 23.5 |
| Colon | 17.1 |
| Liver | 16.6 |
| Rectum | 12.1 |
| Trachea, bronchus, and lung | 9.3 |
| Stomach | 8.5 |
| Pancreas | 6.8 |
| Testis | 6.6 |
| Non-Hodgkin lymphoma | 6.0 |
| All sites | 197.1 |

Female

| | |
|----------------------|-------|
| Breast | 46.8 |
| Corpus uteri | 20.0 |
| Colon | 15.3 |
| Thyroid | 12.6 |
| Ovary | 9.8 |
| Kidney | 9.7 |
| Non-Hodgkin lymphoma | 7.2 |
| Liver | 6.6 |
| Cervix uteri | 6.6 |
| Rectum | 6.6 |
| All sites | 197.9 |

10 major cancers, ASR (World) per 100 000

Male

| | |
|-----------------------------|-------|
| Prostate | 56.5 |
| Trachea, bronchus, and lung | 26.1 |
| Colon | 15.0 |
| Bladder | 13.8 |
| Melanoma of skin | 12.8 |
| Kidney | 12.6 |
| Liver | 11.7 |
| Non-Hodgkin lymphoma | 10.4 |
| Rectum | 9.0 |
| Pancreas | 8.3 |
| All sites | 259.1 |

Female

| | |
|-----------------------------|-------|
| Breast | 79.3 |
| Trachea, bronchus, and lung | 21.8 |
| Thyroid | 20.8 |
| Corpus uteri | 17.0 |
| Colon | 13.6 |
| Melanoma of skin | 9.0 |
| Ovary | 8.5 |
| Non-Hodgkin lymphoma | 7.7 |
| Kidney | 7.3 |
| Cervix uteri | 6.9 |
| All sites | 257.7 |

USA, New Mexico: Hispanic White (2013–2017)
Average annual person-years by sex and age group

SOURCE OF POPULATION

Provided by the United States Census Bureau, based on decennial censuses and several other surveys, from which annual estimates of the population for each state are derived. Population estimates for the denominators of incidence and mortality rates are race-specific, ethnicity-specific, and sex-specific county population estimates aggregated to the state or metropolitan-area level.

10 major cancers, ASR (World) per 100 000

Male

| | |
|-----------------------------|-------|
| Prostate | 48.3 |
| Trachea, bronchus, and lung | 20.2 |
| Liver | 18.5 |
| Colon | 16.5 |
| Kidney | 14.9 |
| Rectum | 10.6 |
| Non-Hodgkin lymphoma | 9.9 |
| Bladder | 9.2 |
| Pancreas | 9.1 |
| Stomach | 6.9 |
| All sites | 237.4 |

Female

| | |
|-----------------------------|-------|
| Breast | 74.9 |
| Thyroid | 21.1 |
| Trachea, bronchus, and lung | 15.9 |
| Corpus uteri | 15.5 |
| Colon | 15.3 |
| Kidney | 9.6 |
| Ovary | 8.1 |
| Cervix uteri | 7.5 |
| Non-Hodgkin lymphoma | 7.5 |
| Pancreas | 6.9 |
| All sites | 247.3 |

USA, New Mexico: Non-Hispanic White (2013–2017)

20 major cancers, ASR (World) per 100 000

| <i>Male</i> | | <i>Female</i> | |
|-----------------------------|-------|-----------------------------|-------|
| Prostate | 83.4 | Breast | 96.6 |
| Trachea, bronchus, and lung | 51.2 | Trachea, bronchus, and lung | 36.4 |
| Melanoma of skin | 22.1 | Corpus uteri | 18.2 |
| Bladder | 19.6 | Colon | 15.4 |
| Colon | 18.8 | Melanoma of skin | 14.7 |
| Kidney | 16.1 | Thyroid | 14.5 |
| Non-Hodgkin lymphoma | 12.9 | Non-Hodgkin lymphoma | 8.7 |
| Liver | 9.7 | Kidney | 8.3 |
| Rectum | 9.5 | Ovary | 7.5 |
| Pancreas | 9.4 | Pancreas | 7.1 |
| Lymphoid leukaemia | 8.2 | Rectum | 6.0 |
| Multiple myeloma | 5.9 | Cervix uteri | 5.4 |
| Brain and nervous system | 5.9 | Bladder | 5.3 |
| Myeloid leukaemia | 5.6 | Other and unspecified | 4.7 |
| Other and unspecified | 5.6 | Lymphoid leukaemia | 4.5 |
| Stomach | 5.5 | Brain and nervous system | 4.5 |
| Oesophagus | 5.0 | Multiple myeloma | 4.2 |
| Thyroid | 4.8 | Myeloid leukaemia | 3.8 |
| Testis | 4.7 | Liver | 3.1 |
| Larynx | 4.7 | Stomach | 2.9 |
| All sites | 348.8 | All sites | 302.0 |

USA, North Carolina: American Indian (2013–2017)
Average annual person-years by sex and age group

SOURCE OF POPULATION
Bridged-race postcensal population estimates were obtained from the National Center for Health Statistics.

NOTES ON THE DATA

*Rates based on low numbers due to small population.

10 major cancers, ASR (World) per 100 000

| Male | |
|-----------------------------|-------|
| Prostate | 70.4 |
| Trachea, bronchus, and lung | 51.0 |
| Colon | 15.7 |
| Kidney | 12.7 |
| Liver | 12.5 |
| Bladder | 10.7 |
| Rectum | 9.1 |
| Pancreas | 7.4 |
| Stomach | 5.8 |
| Non-Hodgkin lymphoma | 4.8 |
| All sites | 252.5 |
| Female | |
| Breast | 61.3 |
| Trachea, bronchus, and lung | 28.6 |
| Corpus uteri | 12.4 |
| Colon | 10.5 |
| Thyroid | 9.4 |
| Kidney | 7.8 |
| Non-Hodgkin lymphoma | 6.0 |
| Ovary | 5.0 |
| Rectum | 4.8 |
| Pancreas | 3.9 |
| All sites | 195.6 |

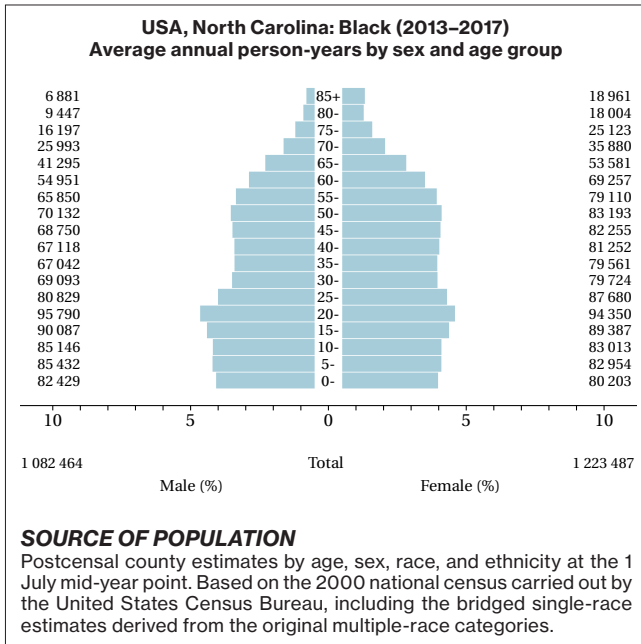

USA, North Carolina: Asian and Pacific Islander (2013–2017)
Average annual person-years by sex and age group

SOURCE OF POPULATION
Bridged-race postcensal population estimates were obtained from the National Center for Health Statistics.

10 major cancers, ASR (World) per 100 000

| Male | |
|-----------------------------|-------|
| Prostate | 31.2 |
| Trachea, bronchus, and lung | 20.8 |
| Liver | 11.3 |
| Rectum | 8.5 |
| Stomach | 7.9 |
| Non-Hodgkin lymphoma | 7.3 |
| Colon | 7.2 |
| Bladder | 6.3 |
| Brain and nervous system | 4.8 |
| Pancreas | 4.7 |

USA, Ohio: Asian and Pacific Islander (2013–2017)
Average annual person-years by sex and age group

SOURCE OF POPULATION

Postcensal county estimates by age, sex, race, and ethnicity at the 1 July mid-year point. Based on the 2000 national census carried out by the United States Census Bureau, including the bridged single-race estimates derived from the original multiple-race categories.

NOTES ON THE DATA

*Rates based on low numbers due to small population.
